Bled, February 2007

Outline

- 1 Introduction
- 2 The Algorithm
 - Overview
 - The Initializing Step
 - The Local Search Step
- 3 Results
 - Artificial Test Sets
 - Biological Test Sets
 - Discussion

The RNA Folding Problem

Aim: predicting the secondary structure of an RNA sequence

e.g.: 5'-UCGGGGCCGGGCCAACCGGGCAGGCCCCA-3'

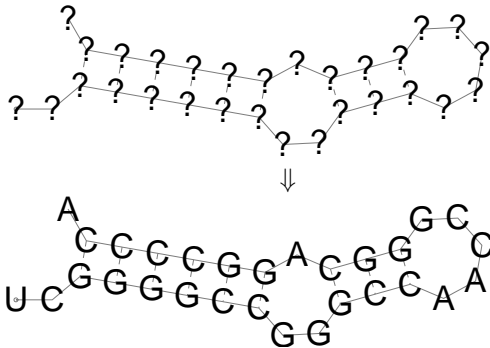

The Inverse RNA Folding Problem

Aim: designing an RNA sequence that folds into a target structure

The Inverse RNA Folding Problem

Aim: designing an RNA sequence that folds into a target structure

Overview and Definition

INFO-RNA

- new approach to **IN**verse **FO**lding of **RNA**
- **Input:** RNA secondary structure T (pseudoknot-free) of length n (set of pairs (i_1, i_2) , where $1 \leq i_1 < i_2 \leq n$)

Overview and Definition

INFO-RNA

- new approach to **IN**verse **F**olding of **RNA**
- **Input:** RNA secondary structure T (pseudoknot-free) of length n (set of pairs (i_1, i_2) , where $1 \leq i_1 < i_2 \leq n$)
- **Output:** RNA sequence $S = S_1 \dots S_n$ that folds into T , where $S_i \in \{A, C, G, U\}$ for $1 \leq i \leq n$

Overview and Definition

INFO-RNA

- new approach to **IN**verse **F**olding of **R**NA
- **Input**: RNA secondary structure T (pseudoknot-free) of length n (set of pairs (i_1, i_2) , where $1 \leq i_1 < i_2 \leq n$)
- **Output**: RNA sequence $S = S_1 \dots S_n$ that folds into T , where $S_i \in \{A, C, G, U\}$ for $1 \leq i \leq n$

Algorithm

The Initializing Step - 1

In and Out

Input: structure T

Output: sequence S^* (adopts T with the lowest possible energy)

$$S^* = \arg \min_{S'} e(S', T)$$

where $e(S', T) =$ free energy of S' folded into T

The Initializing Step - 1

In and Out

Input: structure T

Output: sequence S^* (adopts T with the lowest possible energy)

$$S^* = \arg \min_{S'} e(S', T)$$

where $e(S', T) =$ free energy of S' folded into T

Remind!

$$e(\text{structure}) = \sum_{\text{loop} \in \text{structure}} e(\text{loop})$$

The Initializing Step - 2

Energy Function

- free energies of structural elements (loops), depend on:

The Initializing Step - 2

Energy Function

- free energies of structural elements (loops), depend on:
 - loop size

The Initializing Step - 2

Energy Function

- free energies of structural elements (loops), depend on:
 - loop size
 - closing pairs

The Initializing Step - 2

Energy Function

- free energies of structural elements (loops), depend on:
 - loop size
 - closing pairs + adjacent free bases

The Initializing Step - 2

Energy Function

- free energies of structural elements (loops), depend on:
 - loop size
 - closing pairs + adjacent free bases
- each pair belongs to 2 elements → elements are linked

The Initializing Step - 2

Energy Function

- free energies of structural elements (loops), depend on:
 - loop size
 - closing pairs + adjacent free bases
- each pair belongs to 2 elements \rightarrow elements are linked

The Idea

- specify the minimum free energy of substructures depending on the closing base pair
- start with small substructures (hairpin loops)
- enlarge them gradually by 1 base pair

Example

$$e^{\min} \left(\begin{array}{c} \begin{array}{ccc} 18 & & 19 \\ 17 & \diagdown & \diagup & 20 \\ & 16 & & 21 \\ & 15 & & 22 \\ \mathbf{A}_{15} & & & \mathbf{U}_{22} \end{array} \end{array} \right)$$

- 1 determine the mfe of a hairpin loop for all possible assignments of the closing pair (BP = {A-U, C-G, G-C, U-A, G-U, U-G})
- 2 fix the mfe of the substructure that is one base pair larger for all possible assignments of the last pair: (e.g. A-U)

$$e^{\min} \left(\begin{array}{c} \begin{array}{ccc} 18 & & 19 \\ 17 & \diagdown & \diagup & 20 \\ & \mathbf{A}_{16} & & \mathbf{U}_{21} \end{array} \end{array} \right)$$

$$e^{\min} \left(\begin{array}{c} \begin{array}{ccc} 18 & & 19 \\ 17 & \diagdown & \diagup & 20 \\ & \mathbf{U}_{16} & & \mathbf{A}_{21} \end{array} \end{array} \right)$$

$$e^{\min} \left(\begin{array}{c} \begin{array}{ccc} 18 & & 19 \\ 17 & \diagdown & \diagup & 20 \\ & \mathbf{U}_{16} & & \mathbf{G}_{21} \end{array} \end{array} \right)$$

Example

$$= \min \left\{ \begin{array}{l} e^{\min} \left(\begin{array}{ccc} 18 & & 19 \\ / & & \backslash \\ 17 & & 20 \\ | & & | \\ \mathbf{A}_{16} & & \mathbf{U}_{21} \end{array} \right) + e \left(\begin{array}{ccc} \mathbf{A}_{16} & & \mathbf{U}_{21} \\ | & & | \\ \mathbf{A}_{15} & & \mathbf{U}_{22} \end{array} \right) \\ e^{\min} \left(\begin{array}{ccc} 18 & & 19 \\ / & & \backslash \\ 17 & & 20 \\ | & & | \\ \mathbf{U}_{16} & & \mathbf{A}_{21} \end{array} \right) + e \left(\begin{array}{ccc} \mathbf{U}_{16} & & \mathbf{A}_{21} \\ | & & | \\ \mathbf{A}_{15} & & \mathbf{U}_{22} \end{array} \right) \\ \vdots \\ e^{\min} \left(\begin{array}{ccc} 18 & & 19 \\ / & & \backslash \\ 17 & & 20 \\ | & & | \\ \mathbf{U}_{16} & & \mathbf{G}_{21} \end{array} \right) + e \left(\begin{array}{ccc} \mathbf{U}_{16} & & \mathbf{G}_{21} \\ | & & | \\ \mathbf{A}_{15} & & \mathbf{U}_{22} \end{array} \right) \end{array} \right\}$$

- 1 determine the mfe of a hairpin loop for all possible assignments of the closing pair (BP = {A-U, C-G, G-C, U-A, G-U, U-G})
- 2 fix the mfe of the substructure that is one base pair larger for all possible assignments of the last pair: (e.g. A-U)

The Order

Definition: (Base Pair Order)

The **order** in which base pairs of structure T are examined is defined as

$$(i_1, i_2) \prec (j_1, j_2) \quad \text{if and only if} \quad i_1 > j_1$$

where $(i_1, i_2), (j_1, j_2) \in T$ and $(i_1, i_2) \prec (j_1, j_2)$ means that base pair (i_1, i_2) is analyzed prior to base pair (j_1, j_2) .

The Order

Definition: (Base Pair Order)

The **order** in which base pairs of structure T are examined is defined as

$$(i_1, i_2) \prec (j_1, j_2) \quad \text{if and only if} \quad i_1 > j_1$$

where $(i_1, i_2), (j_1, j_2) \in T$ and $(i_1, i_2) \prec (j_1, j_2)$ means that base pair (i_1, i_2) is analyzed prior to base pair (j_1, j_2) .

Example

Order:

$$(16, 21) \prec (15, 22) \prec (14, 23) \prec (6, 10) \prec \\ (5, 11) \prec (4, 12) \prec (2, 28) \prec (1, 29)$$

Predecessor Base Pairs

Definition: (Predecessor)

All pairs that are part of the structural element that is closed by the current base pair and that are smaller than the current one (conc. the order) are denoted as **predecessors** of the current pair.

Predecessor Base Pairs

Definition: (Predecessor)

All pairs that are part of the structural element that is closed by the current base pair and that are smaller than the current one (conc. the order) are denoted as **predecessors** of the current pair.

Example

Base pair	Predecessor(s)
(16, 21)	none
(15, 22)	(16, 21)
(14, 23)	(15, 22)
(6, 10)	none
(5, 11)	(6, 10)
(4, 12)	(5, 11)
(2, 28)	(4, 12), (14, 23)
(1, 29)	(2, 28)

Dynamic Programming

D =

base pair no. \	1	2	3	4	5	6
	A-U	C-G	G-C	U-A	G-U	U-G
1						
2						
3						
4						
:						

- dynamic programming matrix filled with mfe's
- each row represents a base pair (numbered conc. the order)
- each column represents a possible pair assignment

Dynamic Programming

D =

base pair no. \	1	2	3	4	5	6
	A-U	C-G	G-C	U-A	G-U	U-G
1						
2						
3						
4						
⋮						

- dynamic programming matrix filled with mfe's
- each row represents a base pair (numbered conc. the order)
- each column represents a possible pair assignment

Output of Step 1

S^*

- 1 smallest value of last row of D (mfe a sequence can have when folding into T)
- 2 traceback $\rightarrow S^*$

\Rightarrow no other sequence with lower energy when folding into T

Output of Step 1

S^*

- 1 smallest value of last row of D (mfe a sequence can have when folding into T)
- 2 traceback $\rightarrow S^*$

\Rightarrow no other sequence with lower energy when folding into T

But...

S^* can have less energy when folded into another structure

\Rightarrow seconds step

The Local Search Step

Stochastic Local Search (SLS) - Overview

- finds local optima conc. an objective function

The Local Search Step

Stochastic Local Search (SLS) - Overview

- finds local optima conc. an objective function

Objective Function of INFO-RNA

- **minimizing the structure distance** between the mfe structure of the designed sequence and T

The Local Search Step

Stochastic Local Search (SLS) - Overview

- finds local optima conc. an objective function
- iterative mutations, allows moves to worse sequences

Objective Function of INFO-RNA

- **minimizing the structure distance** between the mfe structure of the designed sequence and T

The Local Search Step

Stochastic Local Search (SLS) - Overview

- finds local optima conc. an objective function
- iterative mutations, allows moves to worse sequences

Objective Function of INFO-RNA

- **minimizing the structure distance** between the mfe structure of the designed sequence and T

SLS - Search Criterion

Retain a tested sequence if it has a better objective function than the current one. Otherwise, keep it with probability p .

Neighborhood

Sequence Neighbors

all sequences S' that differ from S either

- in **one unbound position** or
- in **two paired positions**

Test order of the neighbors

Test Order

Depends on a look-ahead of one mutation step:

- 1 calculate the energy of candidate sequences folded into T : $e(S', T)$
- 2 evaluate their **energy difference** to the energy of the current sequence S folded into T : $e(S, T) - e(S', T)$

Test order of the neighbors

Test Order

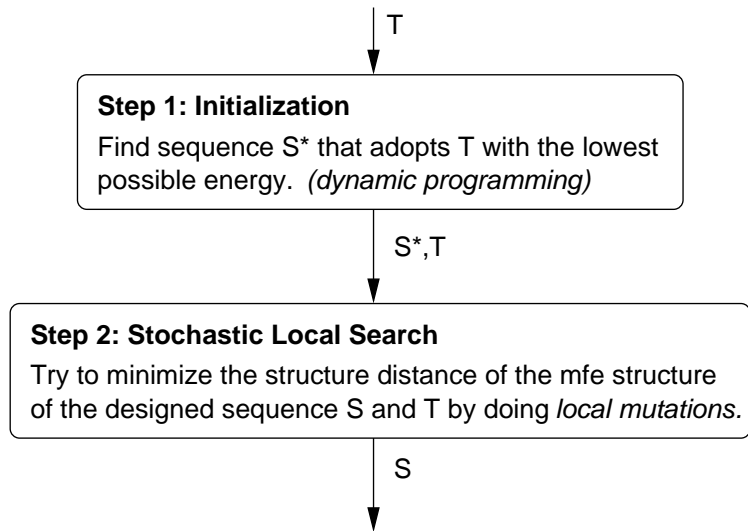

Depends on a look-ahead of one mutation step:

- 1 calculate the energy of candidate sequences folded into T : $e(S', T)$
- 2 evaluate their **energy difference** to the energy of the current sequence S folded into T : $e(S, T) - e(S', T)$

The higher the difference, the earlier the candidate sequence is examined.

Summary

Results

Test sets

- artificial
- biological

Comparison with...

- RNAinverse (Hofacker *et al.*, 1994)
- RNA-SSD (Andronescu *et al.*, 2004)

Results

Test sets

- artificial
- biological

Comparison with...

- RNAinverse (Hofacker *et al.*, 1994)
- RNA-SSD (Andronescu *et al.*, 2004)

Successful run

mfe structure of final sequence = T (otherwise: unsuccessful run)

Artificial Test Sets

Test sets Ia + Ib

- 300 artificially generated structures
- user-given features (size, loop sizes, stem lengths)

Artificial Test Sets

Test sets Ia + Ib

- 300 artificially generated structures
- user-given features (size, loop sizes, stem lengths)

Test set Ia

- size: ≤ 200

Test set Ib

- size: 300 – 700

Artificial Test Sets

Test sets Ia + Ib

- 300 artificially generated structures
- user-given features (size, loop sizes, stem lengths)

Test set Ia

- size: ≤ 200

Test set Ib

- size: 300 – 700

Results: Ia (100 runs per structure) + Ib (10 runs per structure)

	Ia (CSR)	Ia (\bar{E}_T)	Ib (CSR)	Ib (\bar{E}_T)
INFO-RNA	300/300	0.1	300/300	9.1
RNA-SSD	298/300	0.2	294/300	46.8
RNAinverse	294/300	41.9	1/300	-

CSR...fraction of struct. for which the algo. was successful in all runs

\bar{E}_T ...average expected computation time

Biological Test Sets - 1

Test set II

- 308 **computationally predicted structures of known RNA sequences** (all annotated eukaryotic rRNA gene sequences of the Ribosomal Database Project)
- size: 220 – 1975, size-dependent arrangement in classes

Biological Test Sets - 1

Test set II

- 308 **computationally predicted structures of known RNA sequences** (all annotated eukaryotic rRNA gene sequences of the Ribosomal Database Project)
- size: 220 – 1975, size-dependent arrangement in classes

Results for test set II

Sizes in subset	220-400		400-900		900-1975	
	ASR	\bar{E}_T	ASR	\bar{E}_T	ASR	\bar{E}_T
INFO-RNA	100%	2.4	100%	93.3	100%	1447.4
RNA-SSD	93%	226.8	93%	285.3	81%	3043.9
RNAinverse	2.0%	-	0.3%	-	0.0%	-

ASR...average fraction of successful runs

\bar{E}_T ...average expected computation time

Biological Test Sets - 2

Test set III

- structures from the biological literature
- pairs in pseudoknots are disregard

Biological Test Sets - 2

SR...fraction of successful runs
 E_T ...expected computation time

*...originally pseudoknotted structure

Summary and Extensions

So far...

- + very fast and successful new approach to inverse RNA folding
- + outperforms other existing tools in most cases

Summary and Extensions

So far...

- + very fast and successful new approach to inverse RNA folding
- + outperforms other existing tools in most cases
- initializing sequence rather fixed, random sampling with random start sequence
- high GC content (G-C pairs are energetically most favorable)

Summary and Extensions

So far...

- + very fast and successful new approach to inverse RNA folding
- + outperforms other existing tools in most cases
 - initializing sequence rather fixed, random sampling with random start sequence
 - high GC content (G-C pairs are energetically most favorable)

Extensions

- sequence constraints
- allow some violations

The Thermodynamic Model

Decomposition into Loops

$$\text{energy: } e(\text{structure}) = \sum_{\text{loop} \in \text{structure}} e(\text{loop})$$

Recursion (simplified)

Pair i has **no** predecessor: (HL)

$$\forall a \in BP : \quad D(i, a) = \min_{\text{free bases}} e(HL)$$

Recursion (simplified)

Pair i has **no** predecessor: (HL)

$$\forall a \in BP : D(i, a) = \min_{\text{free bases}} e(HL)$$

Pair i has exactly **one** predecessor: (stack, BL, IL)

$$\forall a \in BP : D(i, a) = \min_{b \in BP} \left\{ D(i-1, b) + \min_{\substack{\text{free bases} \\ \text{in } T_i^{i-1}}} e \left(T_i^{i-1} \left| \begin{array}{l} i \rightarrow a \\ i-1 \rightarrow b \end{array} \right. \right) \right\}$$

where T_i^{i-1} = structural element between base pairs $i-1$ and i

Recursion (simplified)

Pair i has **no** predecessor: (HL)

$$\forall a \in BP : D(i, a) = \min_{\text{free bases}} e(HL)$$

Pair i has exactly **one** predecessor: (stack, BL, IL)

$$\forall a \in BP : D(i, a) = \min_{b \in BP} \left\{ D(i-1, b) + \min_{\substack{\text{free bases} \\ \text{in } T_i^{i-1}}} e \left(T_i^{i-1} \left| \begin{array}{l} i \rightarrow a \\ i-1 \rightarrow b \end{array} \right. \right) \right\}$$

where T_i^{i-1} = structural element between base pairs $i-1$ and i

Pair i has **more than one** predecessors: (ML)

$$\forall a \in BP : D(i, a) = e(ML) + \min_{a_1, \dots, a_s \in BP} \left\{ \sum_{k=1}^s D(p_k(i), a_k) \right\}$$

where $p_k(i)$ = k -th predecessor of base pair i

Complexity

- at most $3n$ values in D

no. of predecessor(s) of the base pair	max. no. of steps per base pair	complexity per entry
0	4^4	$O(1)$
1	$6 * 4^4$	$O(1)$
> 1	<i>straight forwardly:</i> exponential in the no. of predecessors <i>additional dynamic programming:</i> all closing pairs of all MLs $\rightarrow O(n)$	

$$\text{Complexity} = 3n * O(1) + O(n) = O(n)$$

Expected Time

Expected time for generating a solution E_T [in CPU seconds]

$$E_T = E_S + \left(\frac{1}{f_S} - 1\right)E_U$$

where E_S ... average time for a successful run
 E_U ... average time for an unsuccessful run
 f_S ... fraction of successful runs
