Bled, 15.2.2016

Viruses

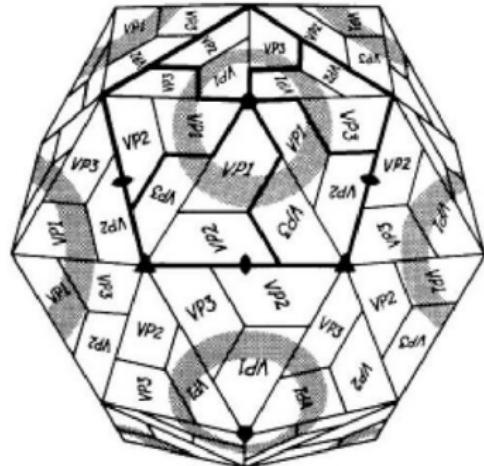

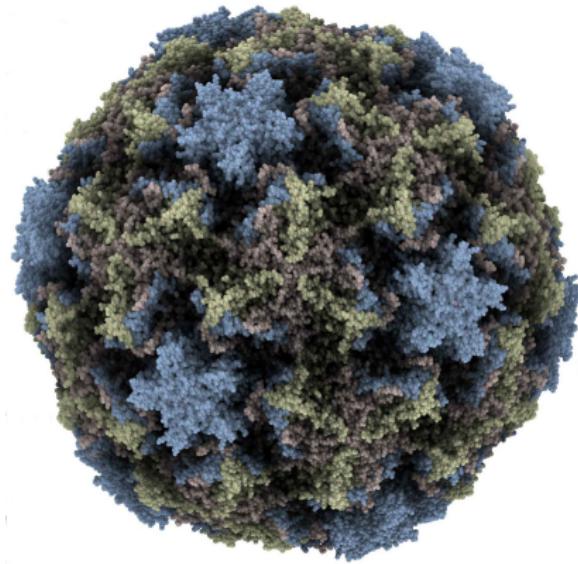

Figure: Crystal Structure and Schematic of Rhinovirus A¹

Genome size (nt): Human: 3.2×10^9 Rhinovirus: 7×10^3

¹Zhao et al. 1996

Viruses and RNA Structure

- Viruses have little space (small genomes) for information storage
- Specific Functions are often provided by RNA Structures

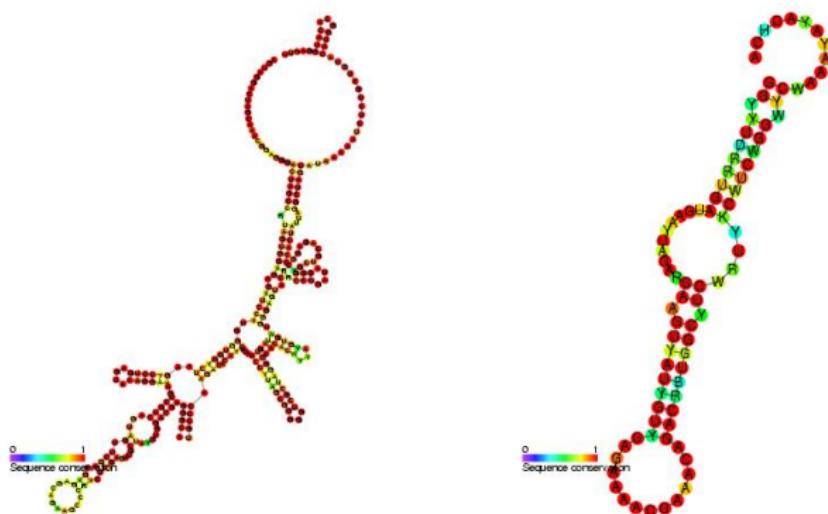

Figure: Pestivirus IRES¹, Rhinovirus CRE-Element

¹Rfam IDs: RF00209, RF00220

Our Arsenal

Tools for prediction of RNA Secondary Structure:

Structure Prediction Tools

RNAfold Prediction of MFE structures/Structure Ensembles

RNAalifold RNA folding with evolutionary constraints

RNAPlfold Local structure Prediction

AliDot Heuristic - predicts plausible Structures from alignments

RNAz Uses machine learning for conserved structure detection

- How do they perform on Viruses?
- Can we use our tools to find annotated structures?
- What is the optimal approach?

HIV1 Structure - The Gold Standard

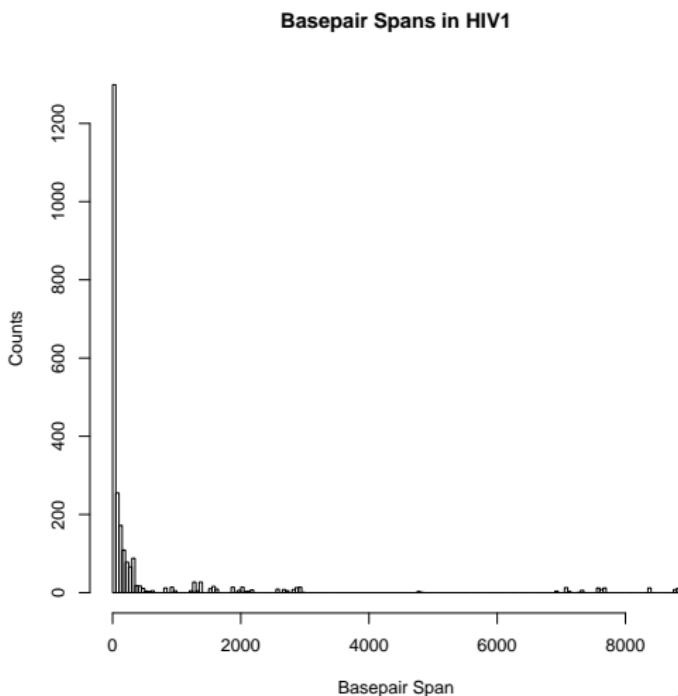

Figure: HIV1 genome, folded with SHAPE-Data¹

¹Watts et al. 2009

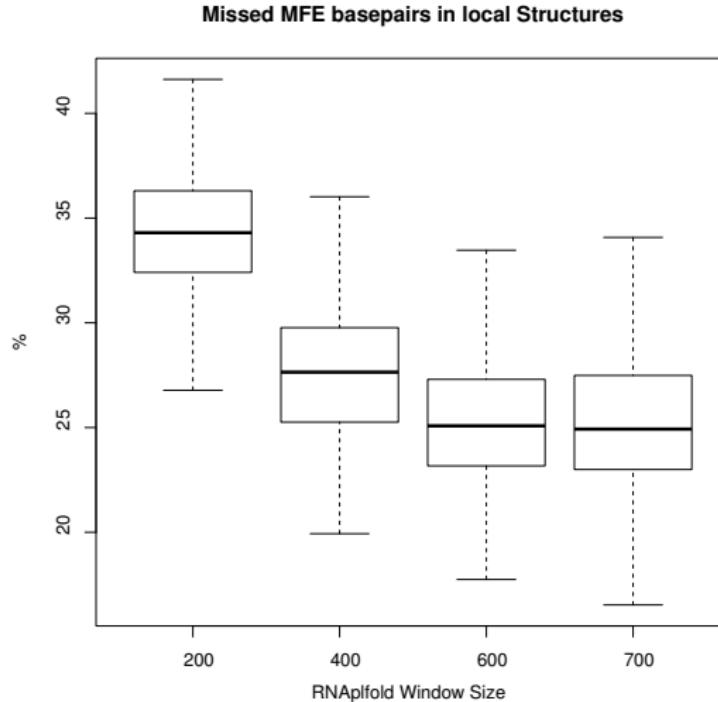

Local vs. Global Folding

How far reaching are base-pairings in HIV1?

Local vs. Global Folding

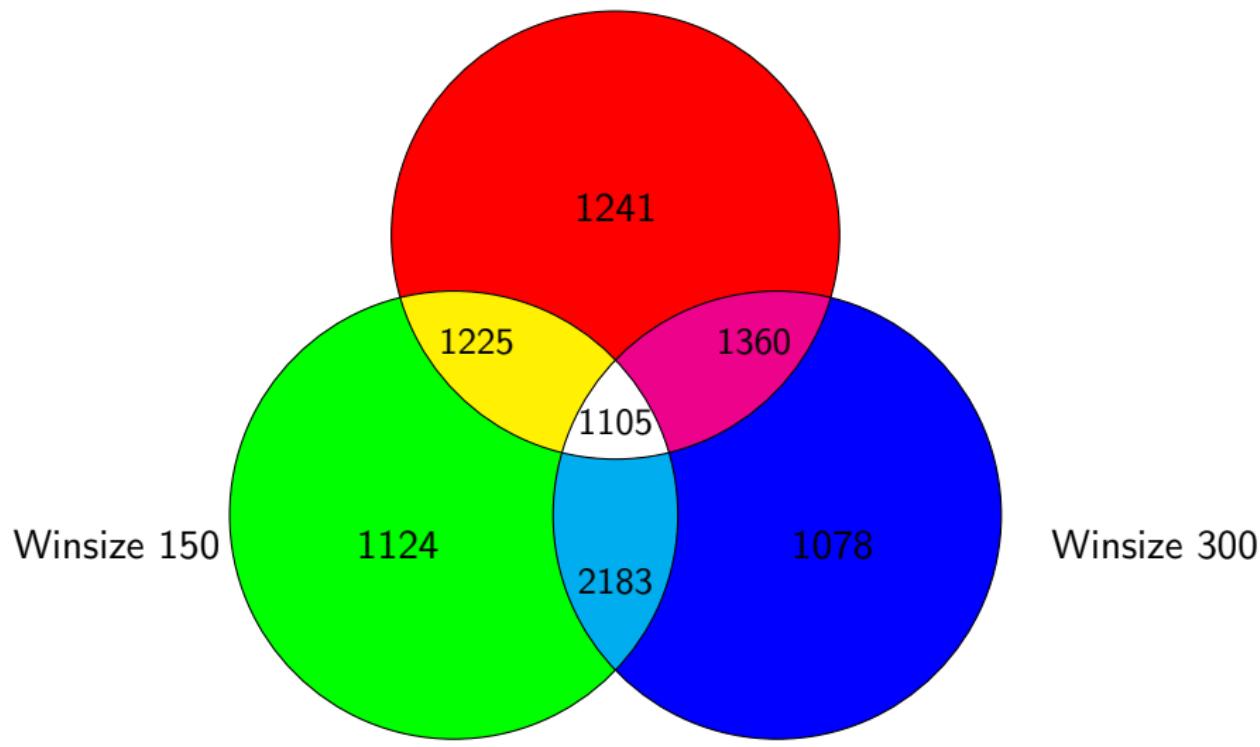

How many HIV1-MFE basepairs do we miss by folding locally?

Global vs. Local Folding

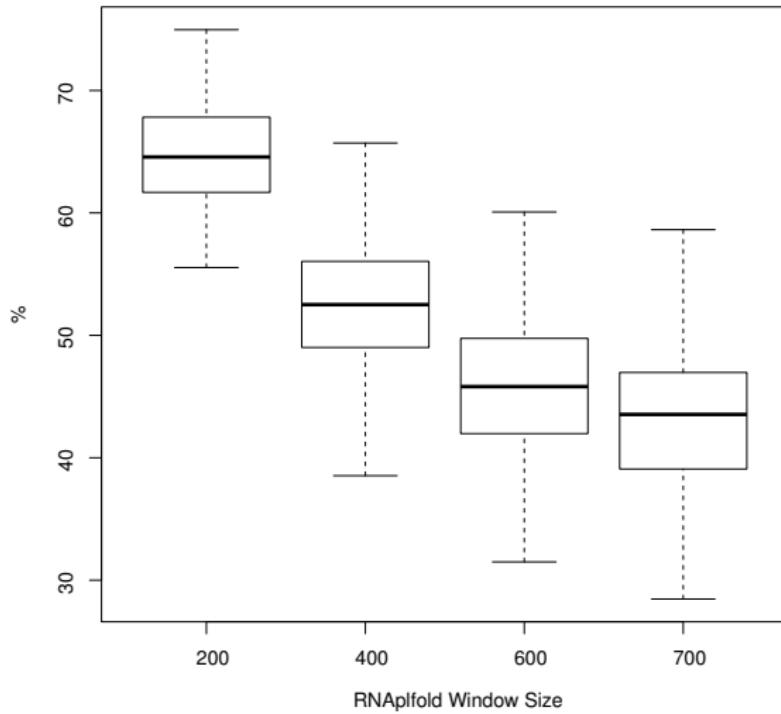

RNAfold vs RNApifold - Shared Basepairs

RNAfold - with SHAPE constraints

Local vs. Global Folding

Missed MFE basepairs > Window size

Annotated viral RNA Structures

Name	Hits	Length
RRE	200	336
HIV_GSL3	200	83
HIV_POL-1_SL	200	112
HIV_FE	186	51
HIV-1_SL4	175	19
HIV-1_DIS	148	39
mir-TAR	139	60
HIV-1_SL3	129	22
HIV-1_SD	121	18
HIV_PBS	90	96
astro_FSE	3	51
mir-224	1	96

Table: Rfam - Annotated RNA structures in 200 Reference HIV1 genomes

Reproduction of Rfam-annotated Structures

Element 1: HIV-1_DIS (Retroviral Psi packaging element)

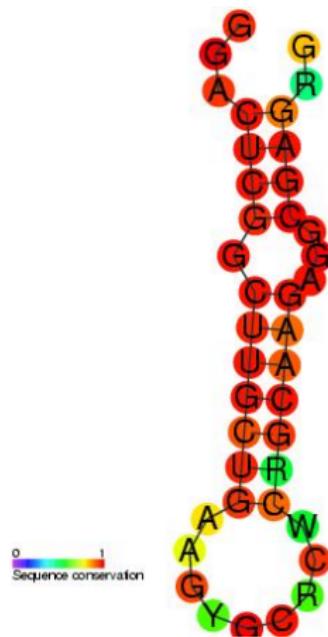

Figure: HIV Retroviral Psi packaging Element

Reproduction of Rfam-annotated Structures

Reference (Rfam)	...((((.((((((.....))))))....)))...
RNAfold (global)))...))(((((((.((((((.....((....
RNAfold (local)	..((((.((((((.((....).))))))....)))...

Table: HIV1 Psi Packaging Element, Alignment Size: 200, MPI = 86.91

Reproduction of Rfam-annotated Structures

Reference (Rfam)	Structure
RNAfold (global)	...(((((((.....))))))....))...
RNAfold (local))...)((((((.((((.....((....

Table: HIV1 Polymerase 1 stem loop, Alignment Size: 200, MPI=87.99

Summary

- Even though long range interactions are found, the HIV1 genome is dominated by short-range base pairings
- Unconstrained, global Folding fails to reproduce known structures
- Sequence - based alignments can bias consensus-structure based folding of viral structures
