Transcriptome-wide Structure Probing with Lead-Seq

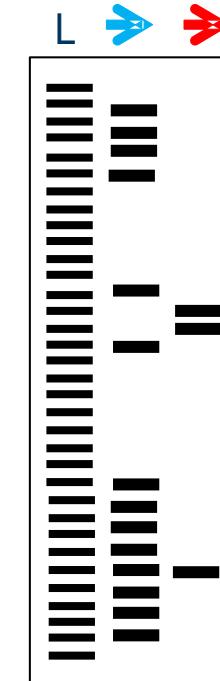

Vivian Brandenburg
35th TBI Winterseminar in Bled
12/02/20

RNA Structure Probing

S1 → cuts single-stranded nt
V1 → cuts double-stranded nt

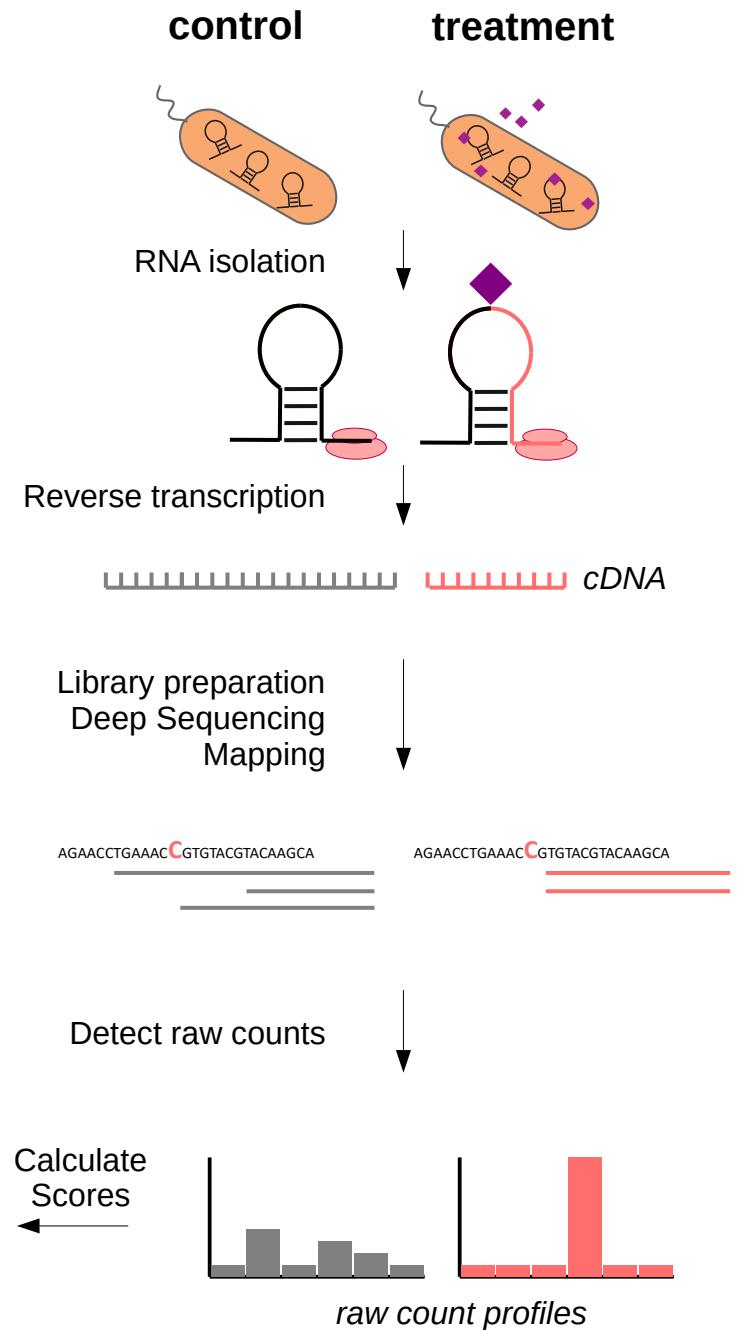

Ehresmann *et al.*, 1987

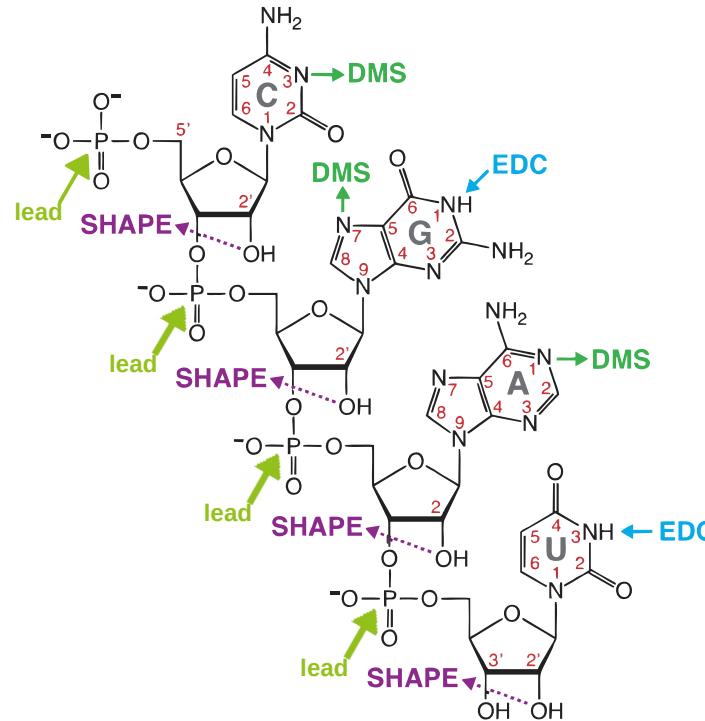

Polyacrylamide urea gel
→ separation of fragments by size
→ detection via radioactive P-32

Global RNA Structure Probing

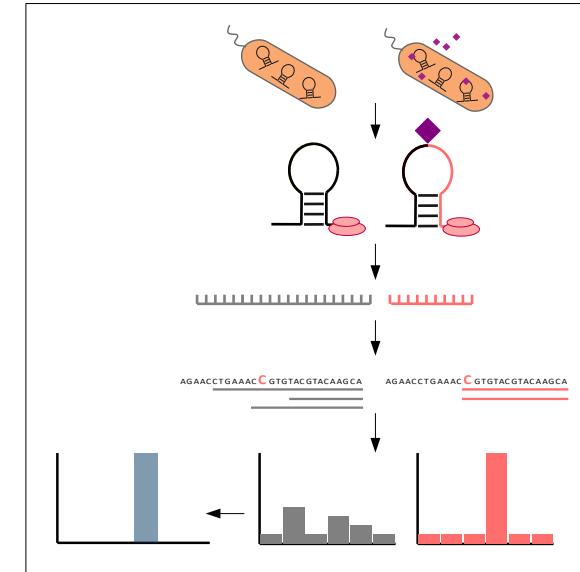

- Structure Probing + NGS
- **Structurome** = Structure of all RNAs in a cell
- *In vitro*: enzymes
- *In vivo*: chemical agents

Chemical Agents for *in vivo* probing

Adapted from Mitchell et al., 2019

- DMS: alkylation of Watson-Crick-face of A and C
→ can be combined with e.g. EDC
- SHAPE: 2'-OH acylation of ribose sugar
- Lead: nucleophilic attack of phosphorus group

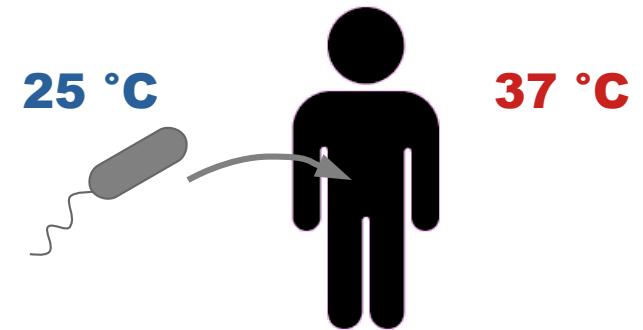

Y. pseudotuberculosis

- Gram-negative γ -proteobacterium
- Closely related to *Y. pestis* / plague
- Mammalian pathogen
- Gut-associated diseases

Extensive regulatory response to temp. changes

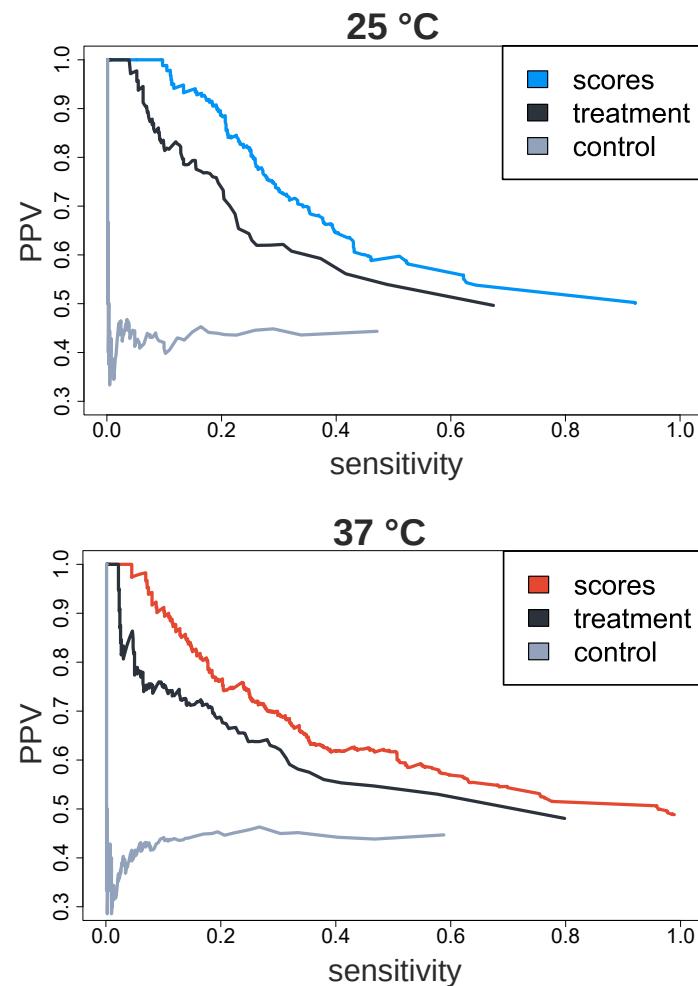

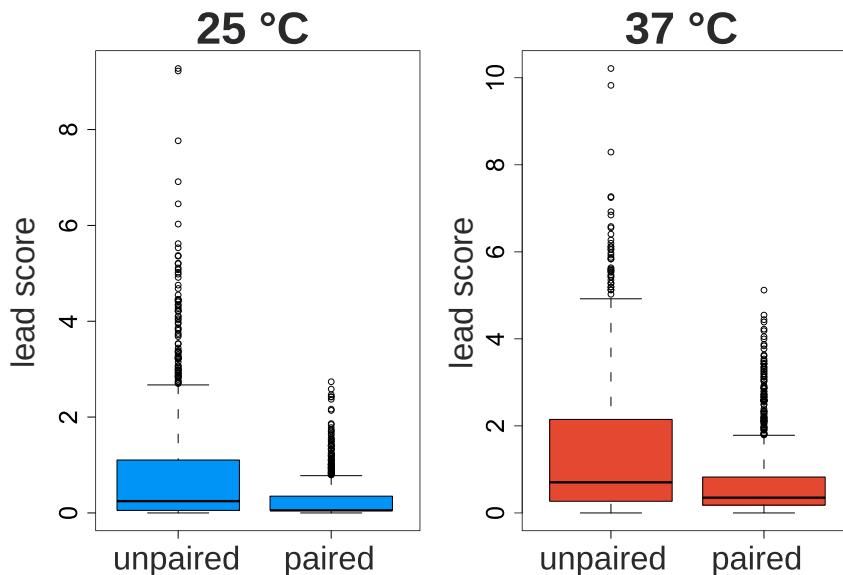

- > 300 genes differentially expressed
(Nuss et al., 2015)
 - virulence, metabolism, diverse stress response

Lead-Seq at $25\text{ }^{\circ}\text{C}$ and $37\text{ }^{\circ}\text{C}$

Reliability of Lead Scores: tRNAs

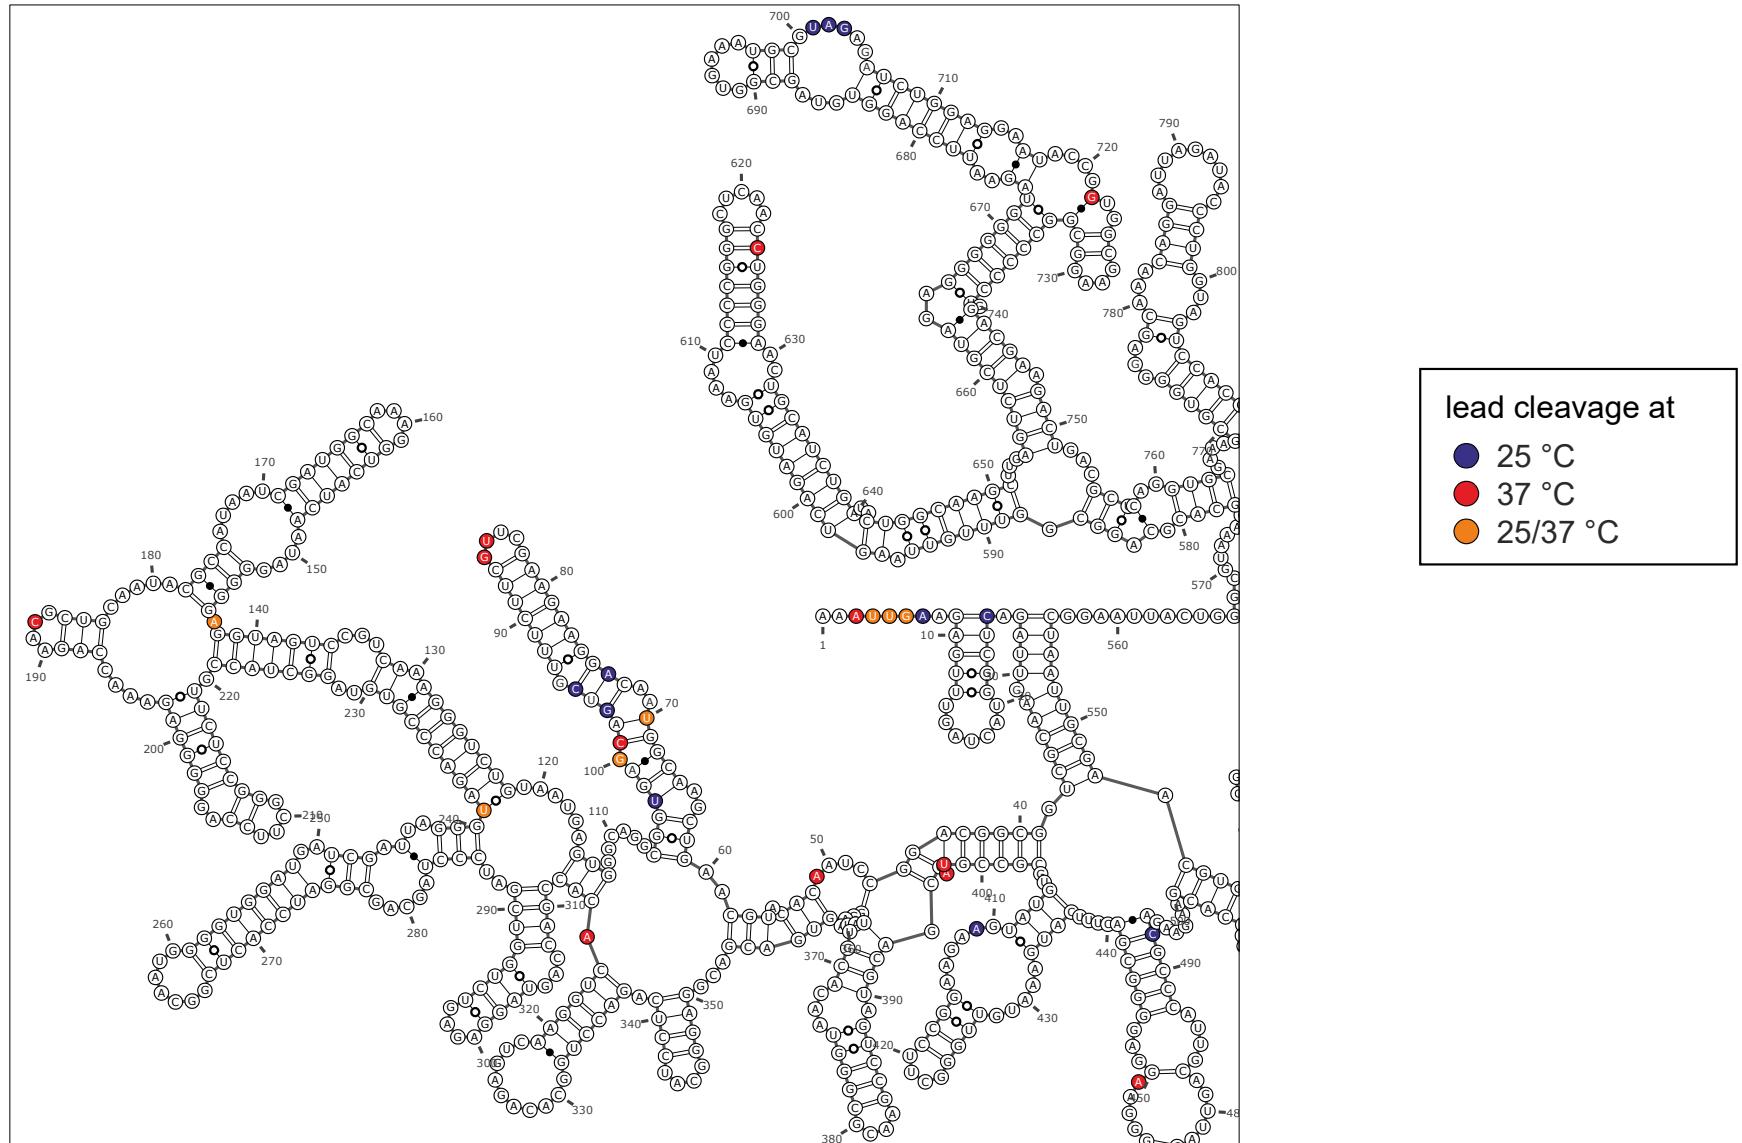

Test data: 32 tRNAs (764 paired + 665 unpaired nt)

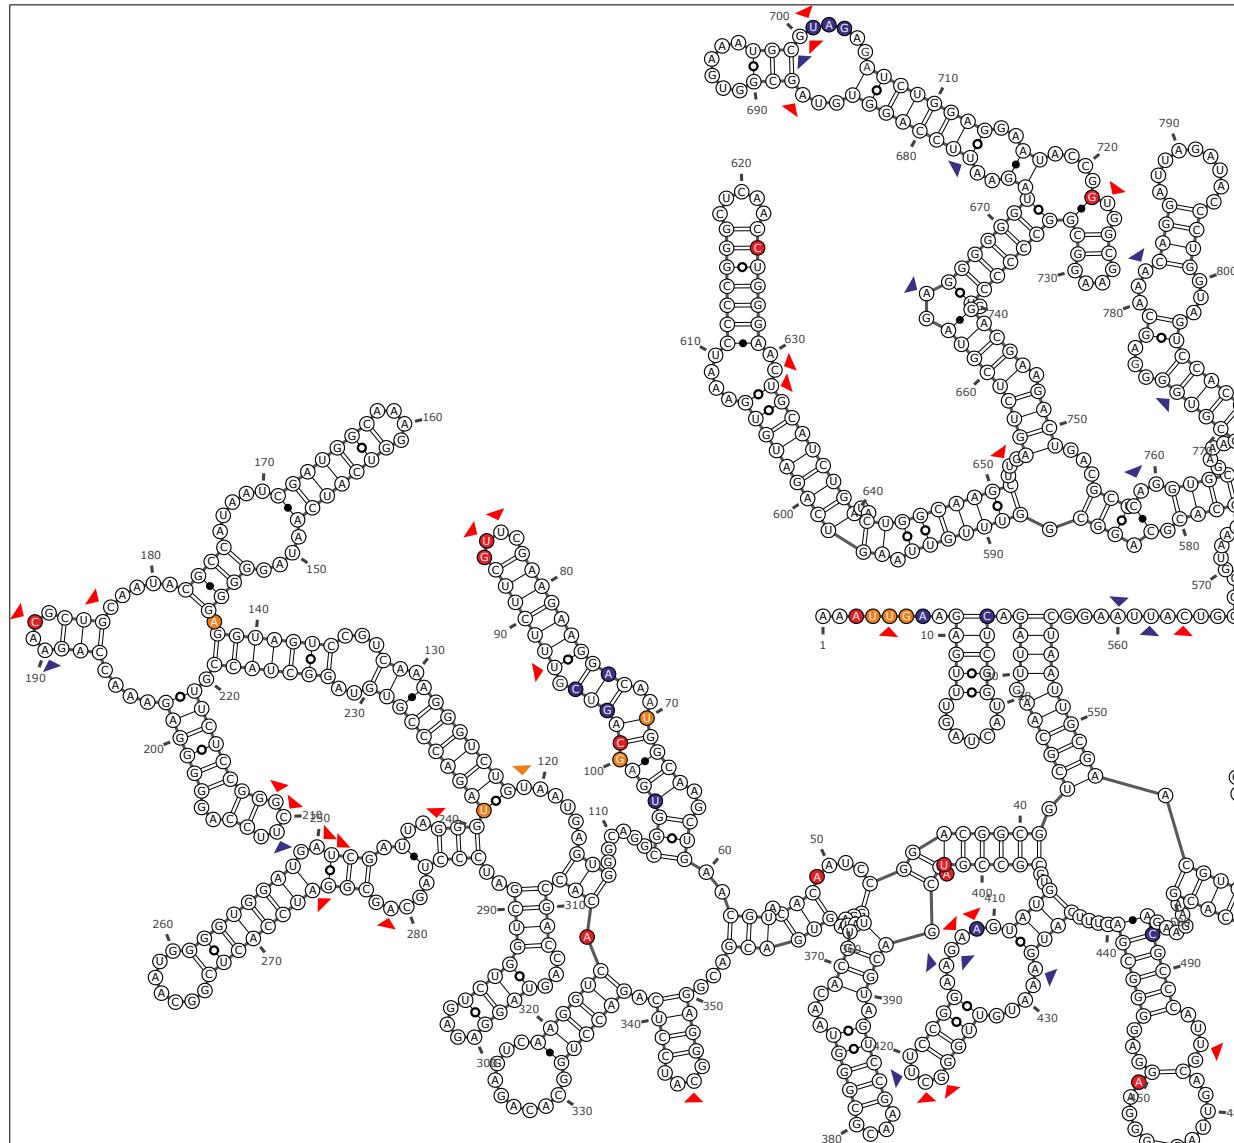

PPV: How many of the nt with scores are actually unpaired?

Sensitivity: how many of all unpaired nt can we detect?

Reliability of Lead Scores: 16S-rRNA

Reliability of Lead Scores: 16S-rRNA

lead cleavage at

- 25 °C
- 37 °C
- 25/37 °C

strong reactivity

- DMS Mustoe et al., 2019
- SHAPE McGinnis et al., 2015

Secondary Structure Prediction

Problem: No information about pairing partners

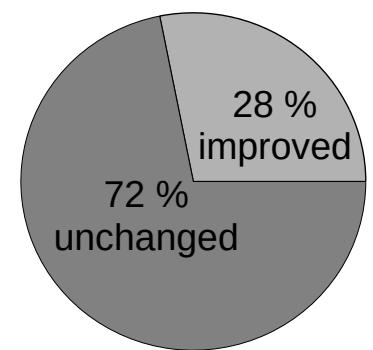

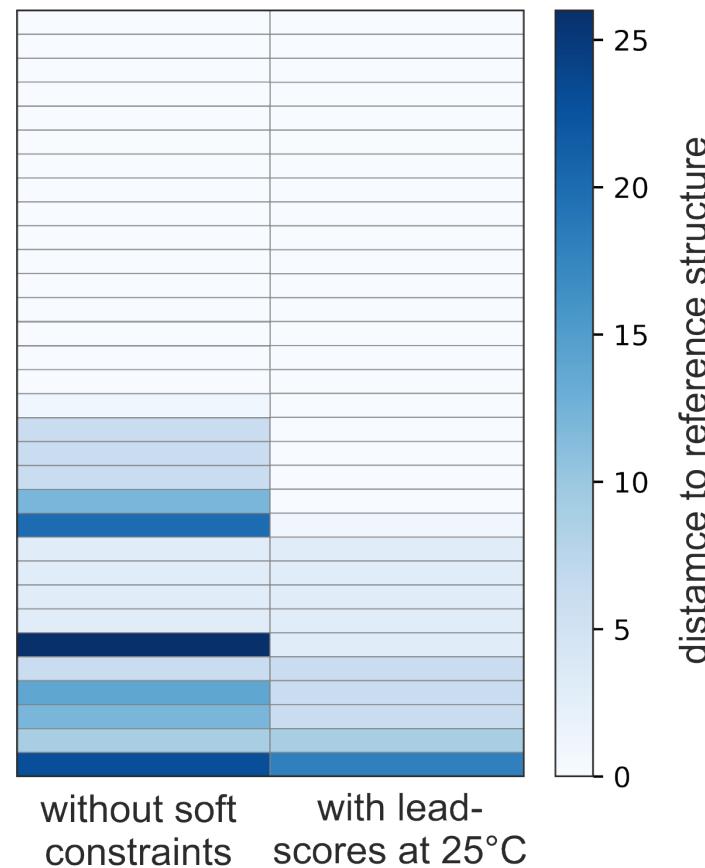

Solution: RNA structure prediction with soft constraints with ViennaRNA 2.0

approach from Washietl *et al.*, 2012 (RNAPvmin: tauSigmaRatio=0.6)

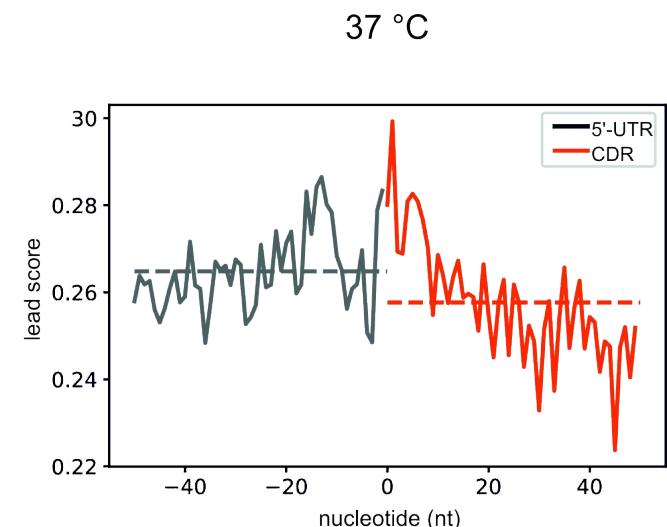

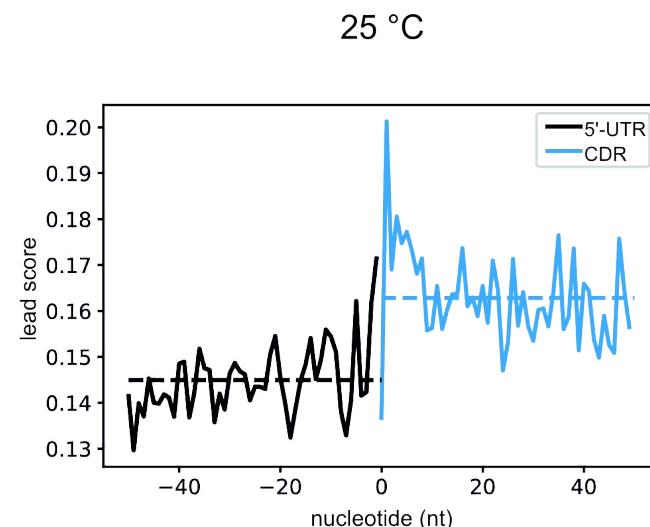

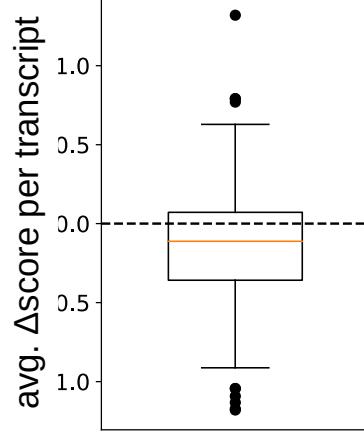

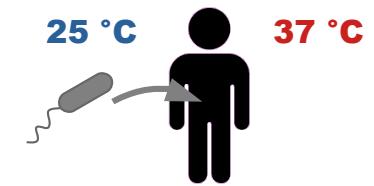

Test data: 32 tRNAs

Pre-processing:

- cap at 90 %
- rescale to range 0, 2
- exclude all < 1

Temp. comparisons

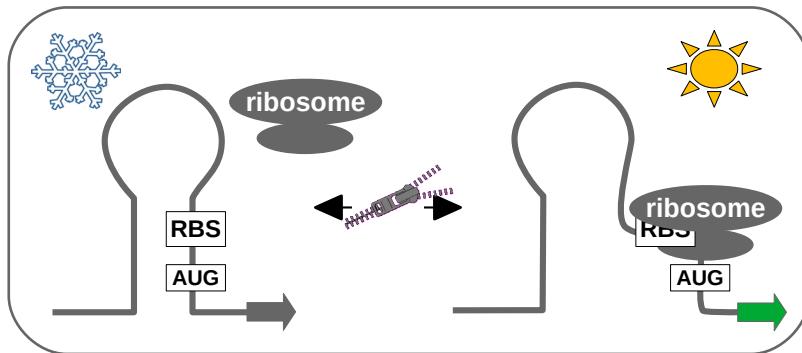

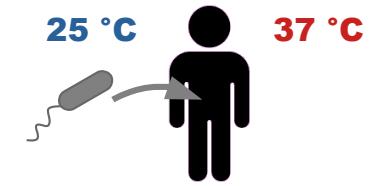

Same results: HIV-1 virions, Fruit flies, humans

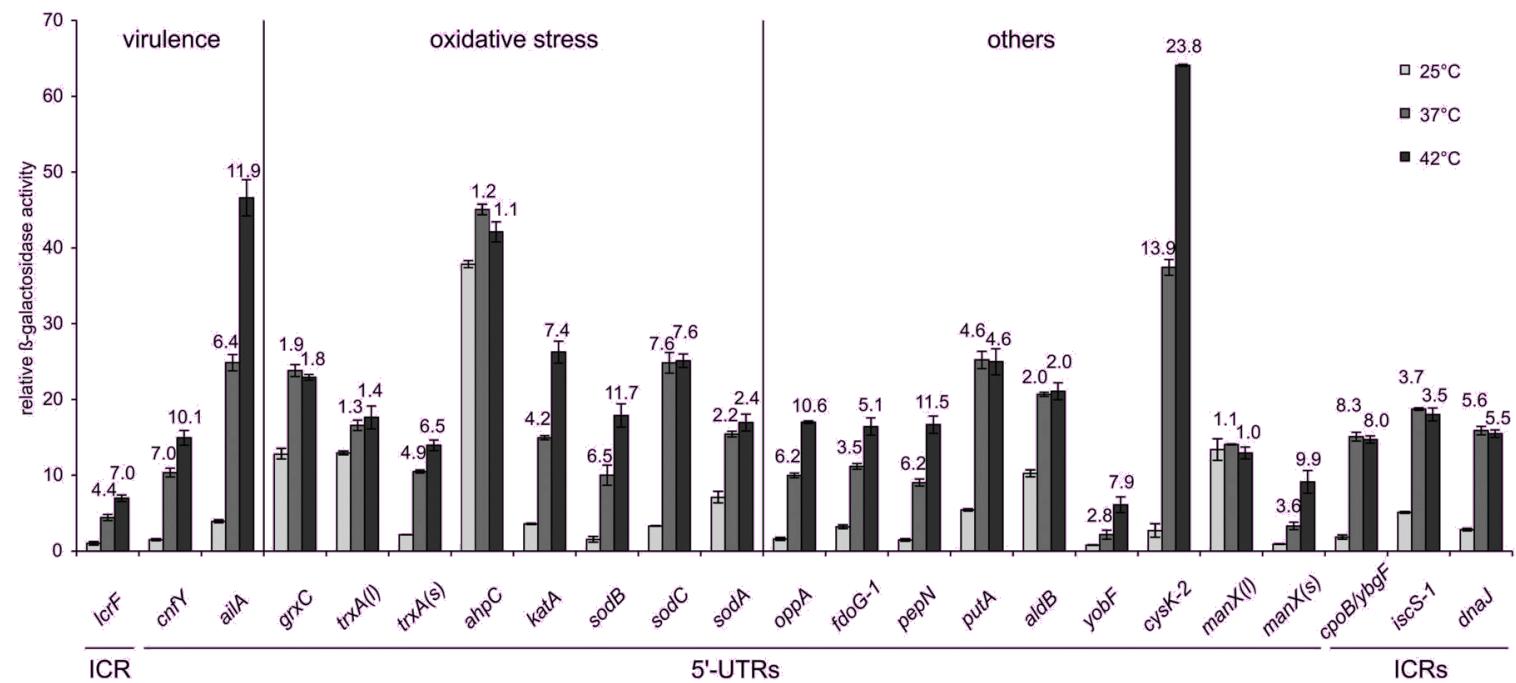

Different: Arabidopsis th., rice, yeast

Same result: rice

RNA Thermometers

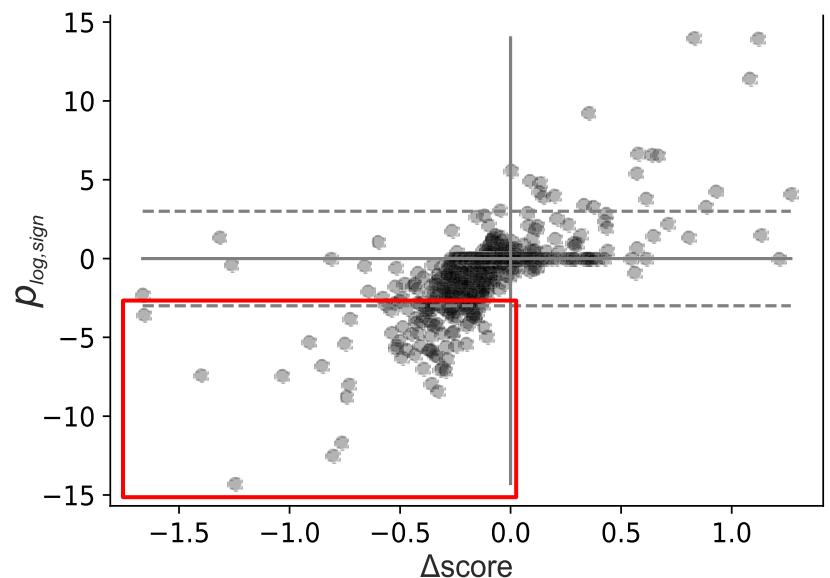

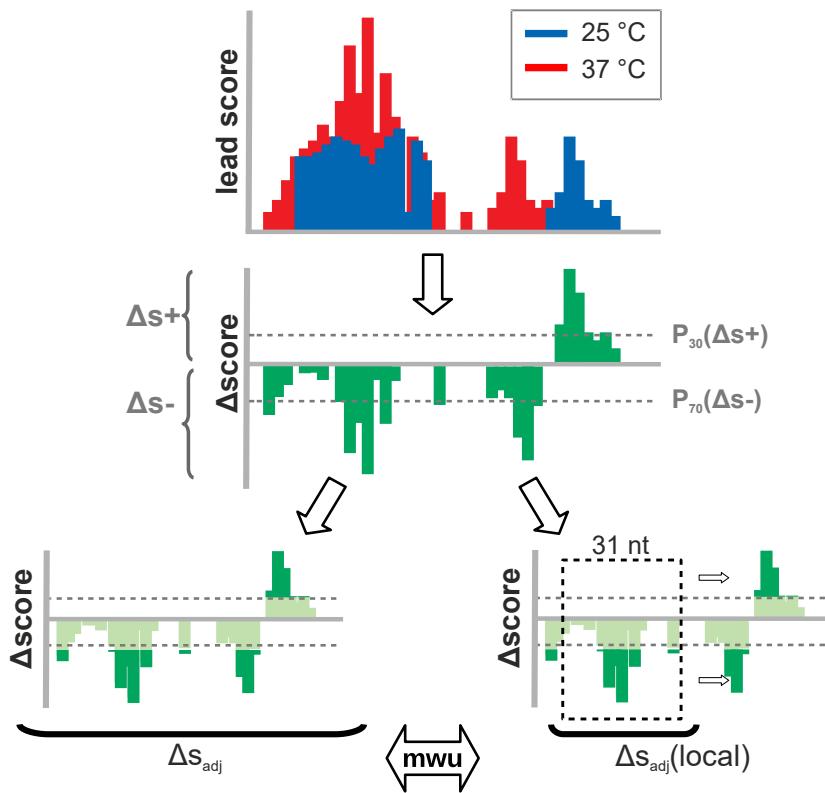

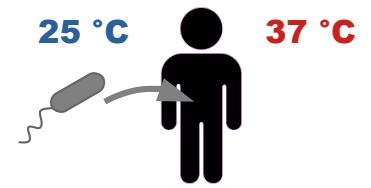

- Diverse examples in bact. pathogens
- *Yersinia pseudotuberculosis*
 - LcrF: major virulence regulator (Böhme et al., 2012)

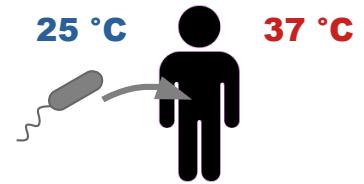

Righetti et al., 2016

RNA Thermometers

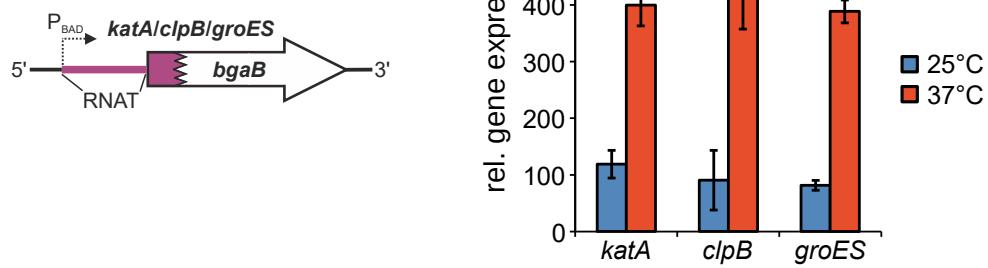

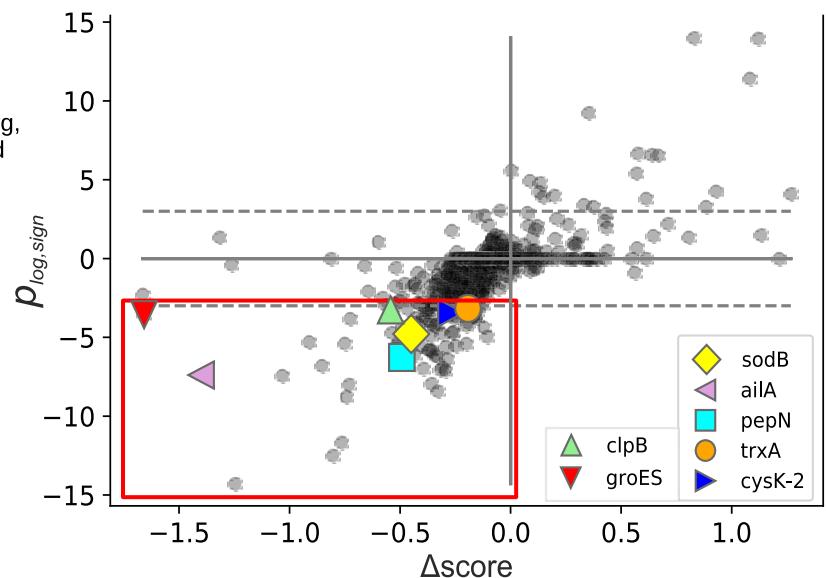

RNA thermometer

gene	gene description	Δ score	$p_{\log, \text{sign}}$
<i>ailA</i>	outer membrane protein	-1.4	-7.4
<i>pepN</i>	aminopeptidase	-0.5	-6.3
<i>sodB</i>	superoxide dismutase	-0.5	-4.8
<i>cysK-2</i>	cysteine synthetase	-0.3	-3.4
<i>trxA</i>	thioredoxin	-0.2	-3.2
<i>groES</i>	chaperonin	-1.7	-3.6
<i>clpB</i>	ATP-dependent chaperone	-0.5	-3.3

Righetti *et al.*, 2016
Brandenburg,
unpublished

Summary

- Lead-Seq
 - Reliable information about tRNAs + larger molecules
 - Improve secondary structure predictions with soft constraints
- *Y. pseudotuberculosis'* structurome at 25 °C + 37 °C
 - General melting at higher temperature
 - 5'-UTRs more structured than CDS at 25 °C
 - Known + unknown RNA thermometers detectable
