Simulation Setup

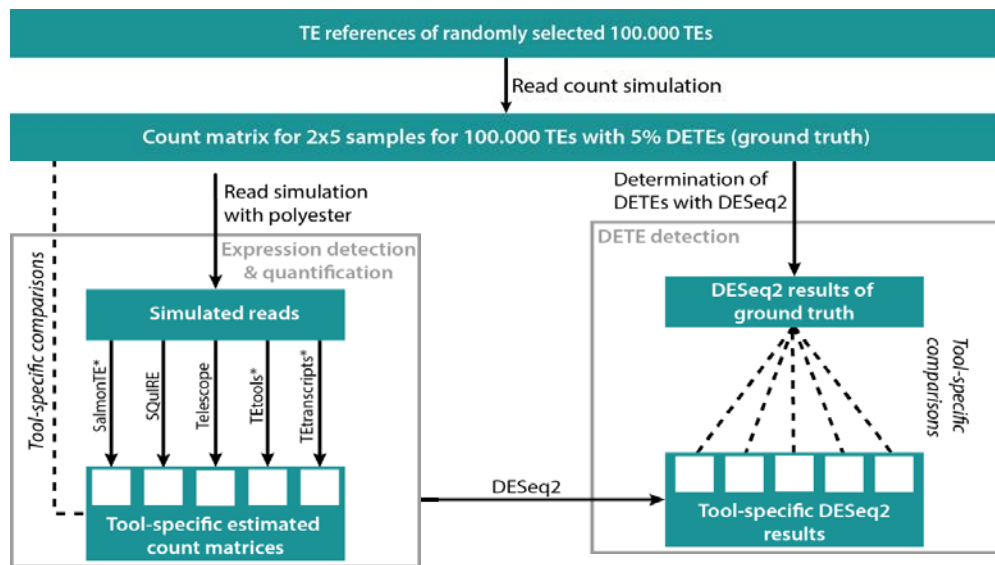

Simulation Setup

Expression detection

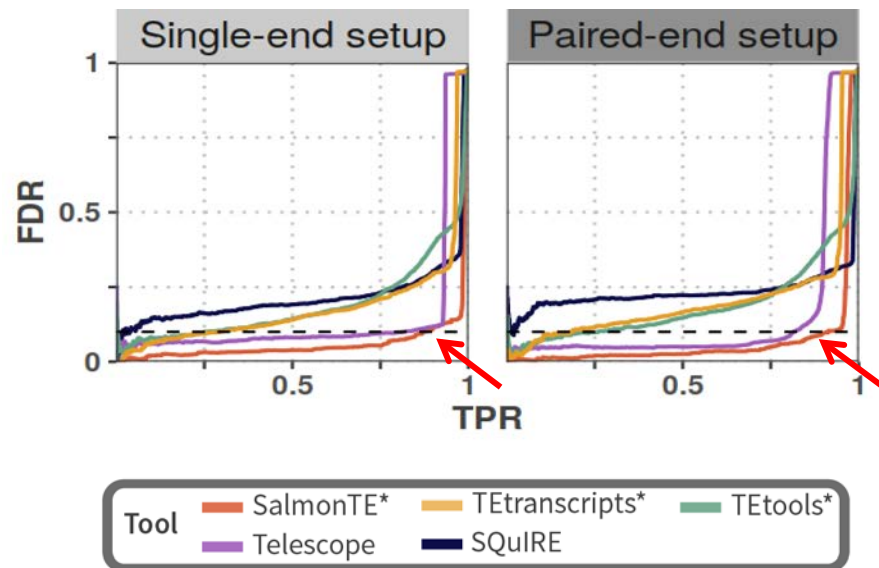

Simulation Setup

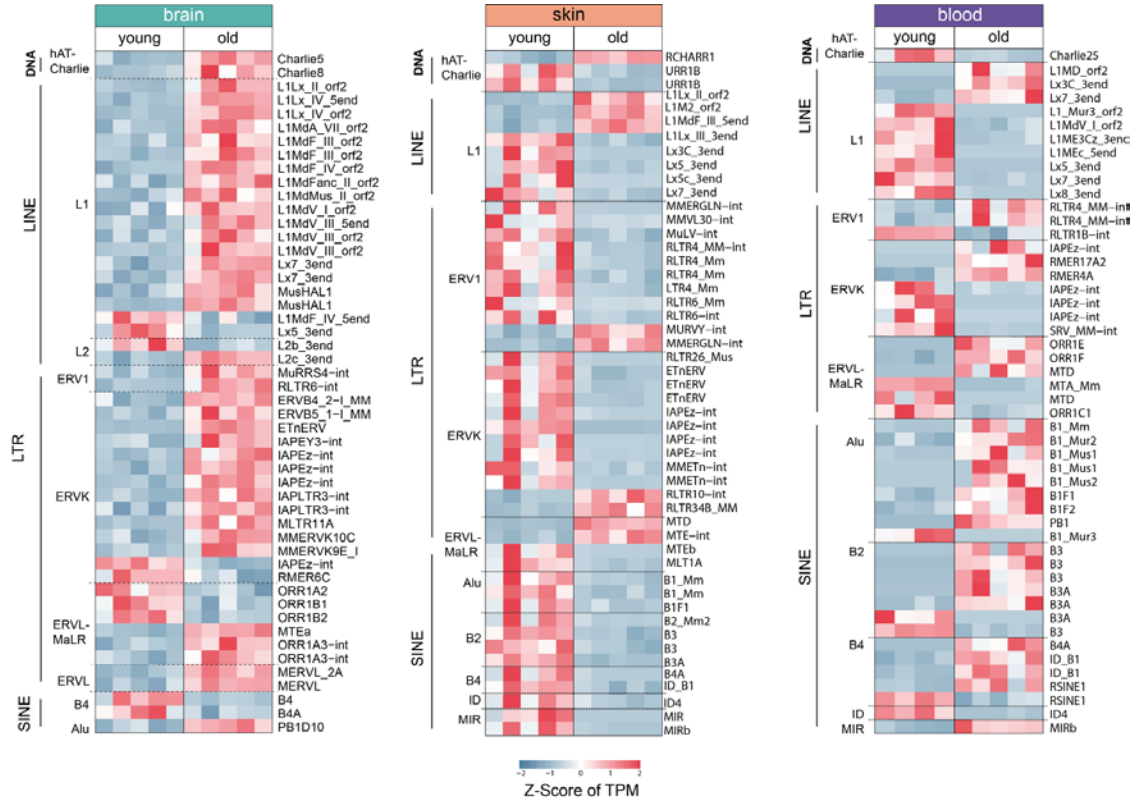

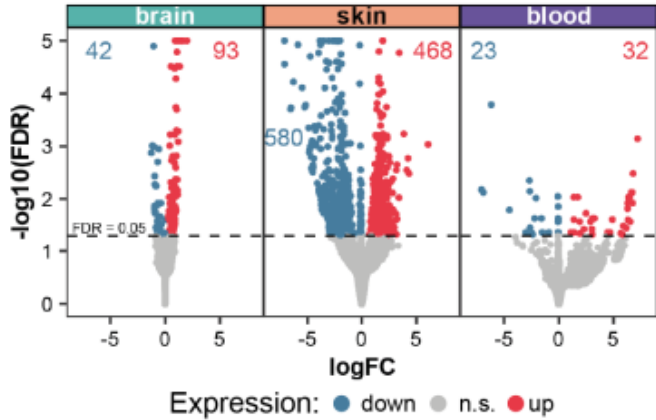

With only slight modifications to existing methods, locus-specific TE expression analysis works surprisingly well for conventional paired-end sequencing data.

DETE detection

fli Genome-wide TE expression profiles in aging mice

24 vs. 6 months

- Family-based analysis likely miss important dysregulation
- TE expression family-independent and tissue specific

fli Independently expressed?

Sequencing, Visualization & Analysis of data

Expression Profiling

Comparison among major gene expression analysis techniques

<https://cage-seq.com/>

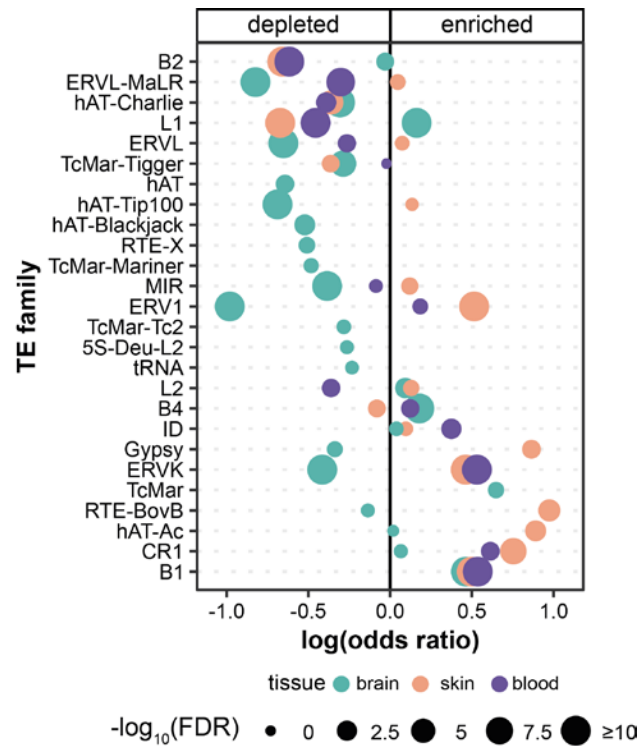

- CAGE-Seq enriches Cap structure of RNAs
- CAGE tags indicate transcription start sites (TSS)
- Especially helpful to investigate transcript structures
- Established by the FANTOM consortium

➔ **Identification of independent TE expression**

Detection of independently expressed TEs via CAGE-Seq

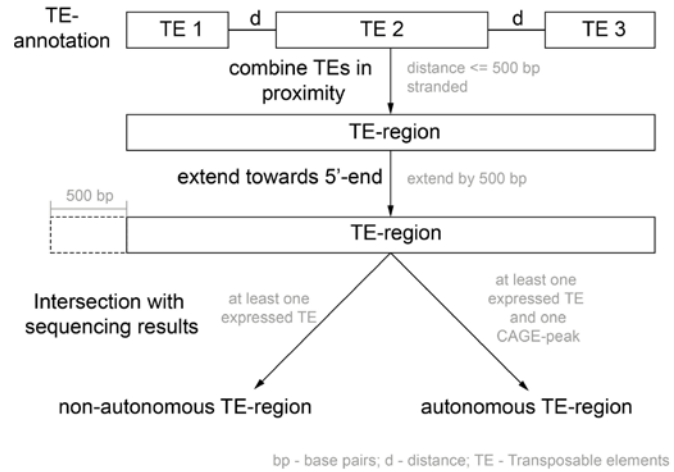

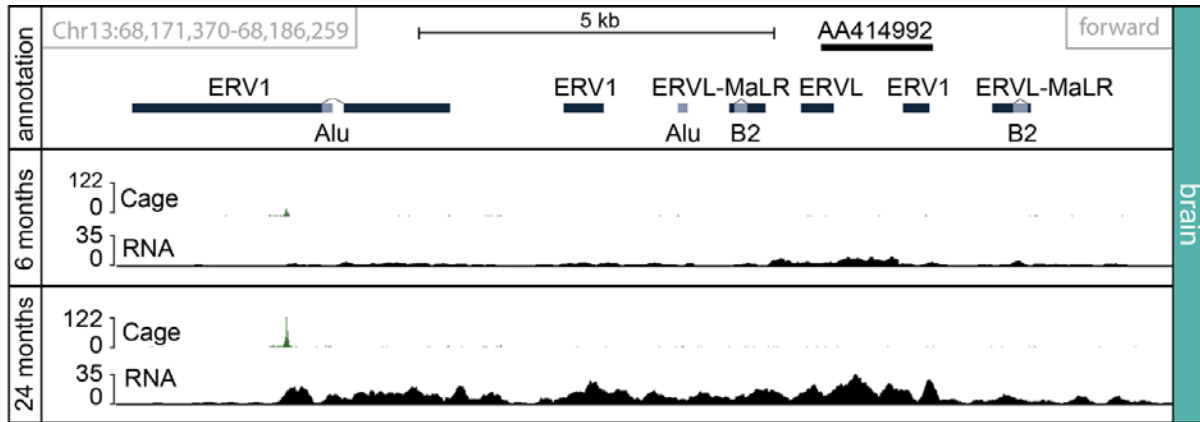

- TE-CAGE peaks are tissue-specifically enriched/depleted

fli Shared transcription start sites - TE regions

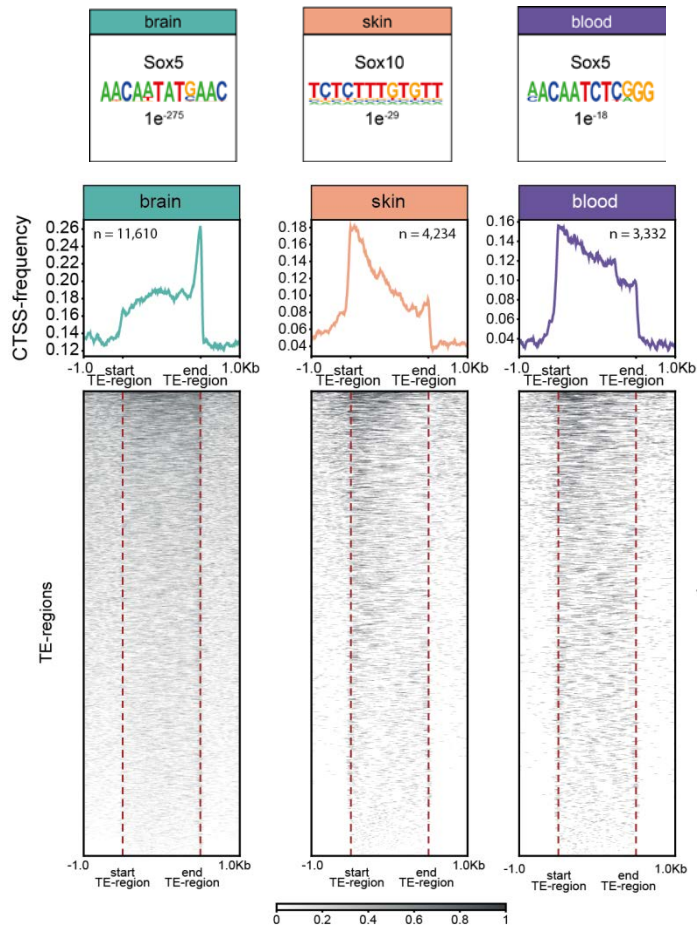

fli Shared transcription start sites - TE regions

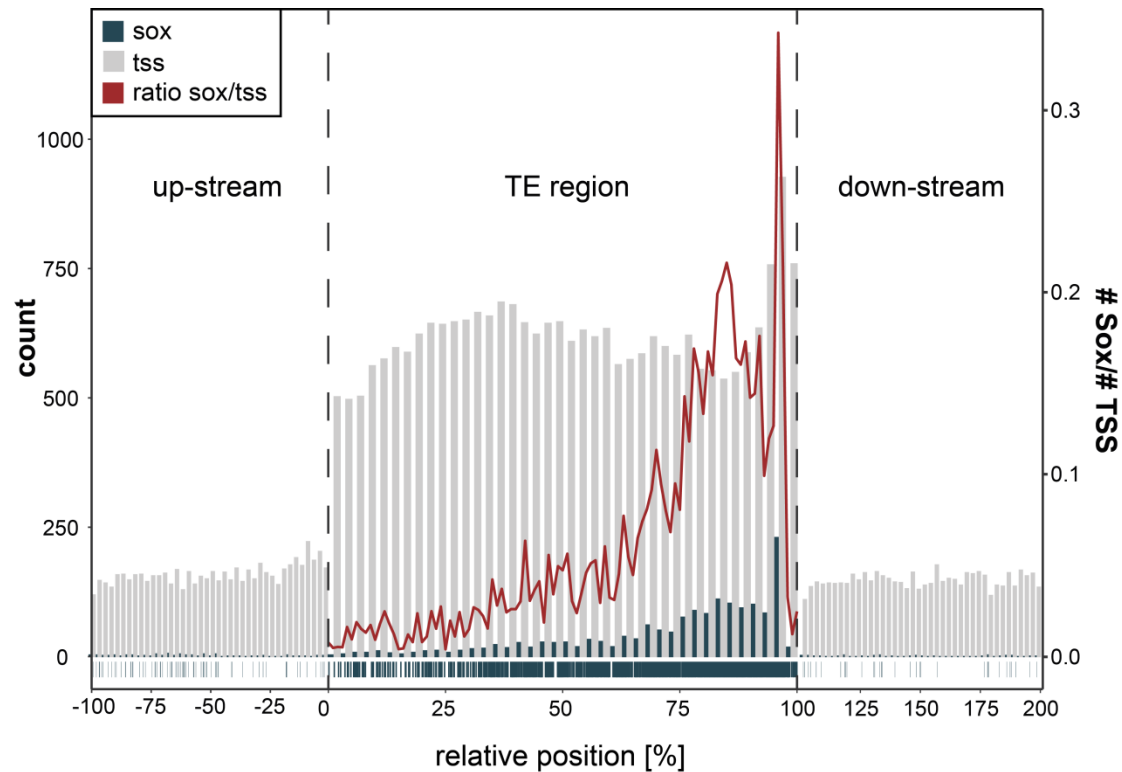

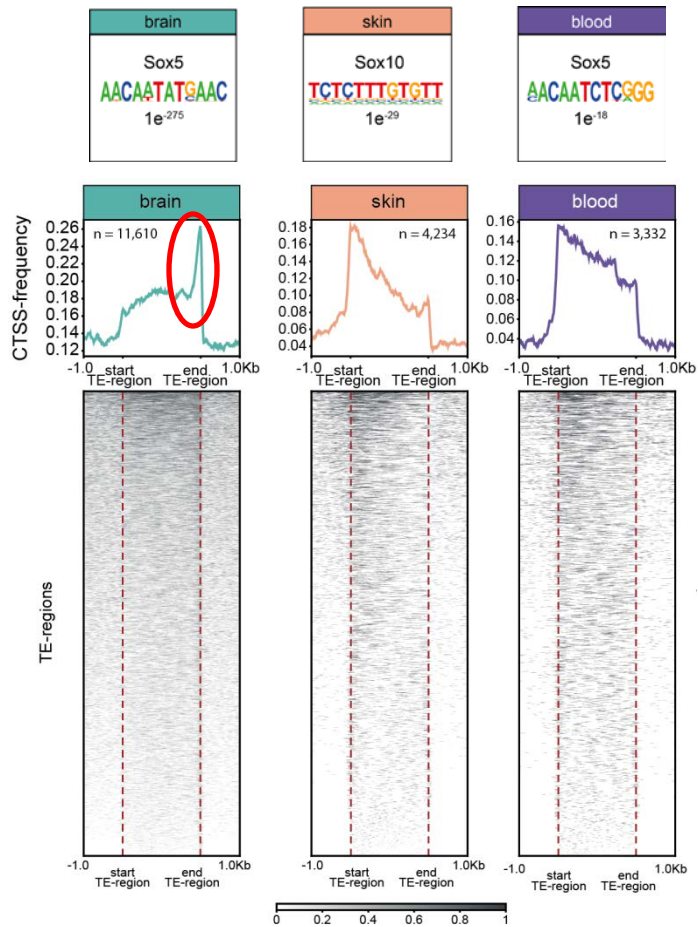

Where does the TE expression start?

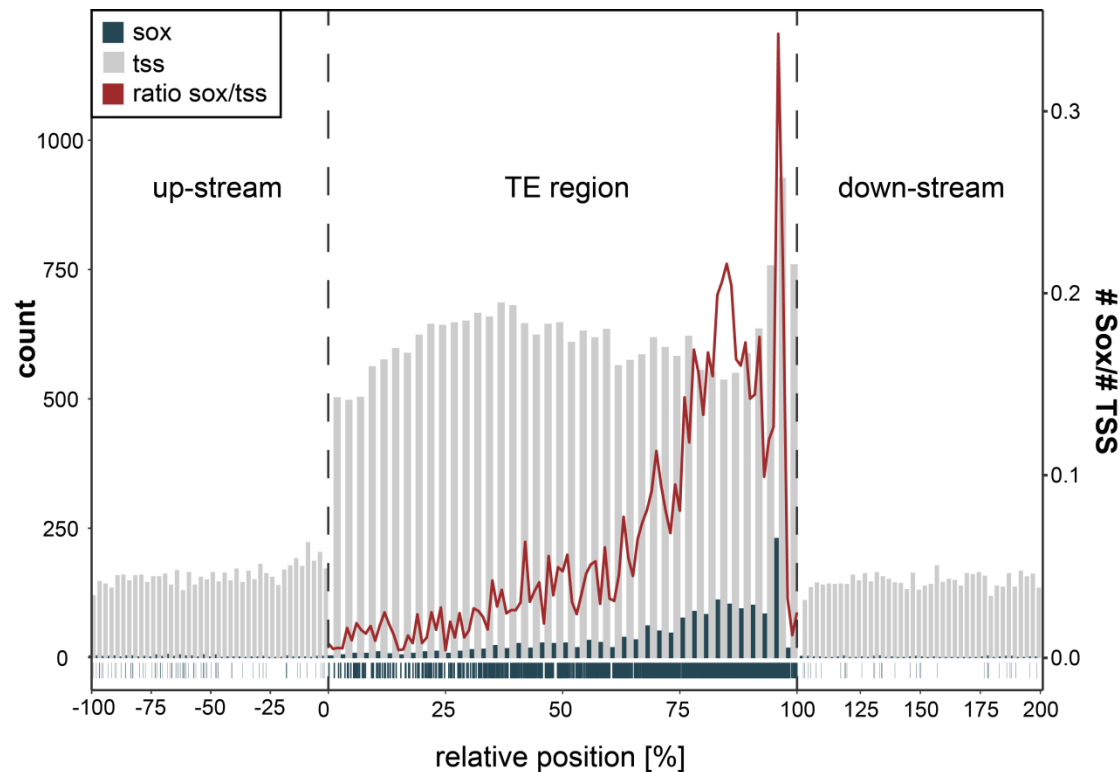

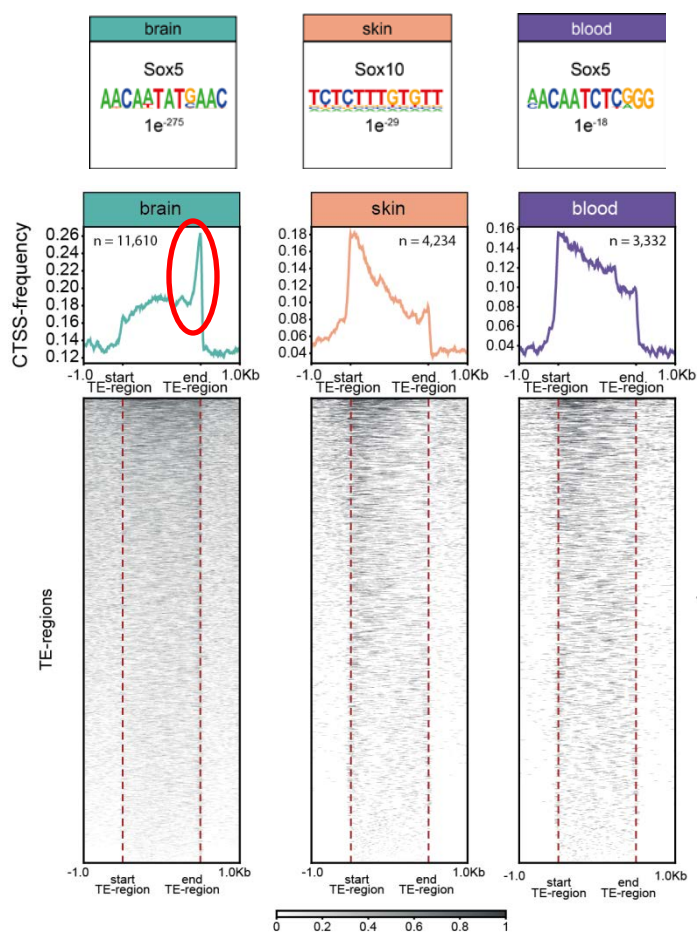

fli Where does the TE expression start?

fli Where does the TE expression start?

Where does the TE expression start?

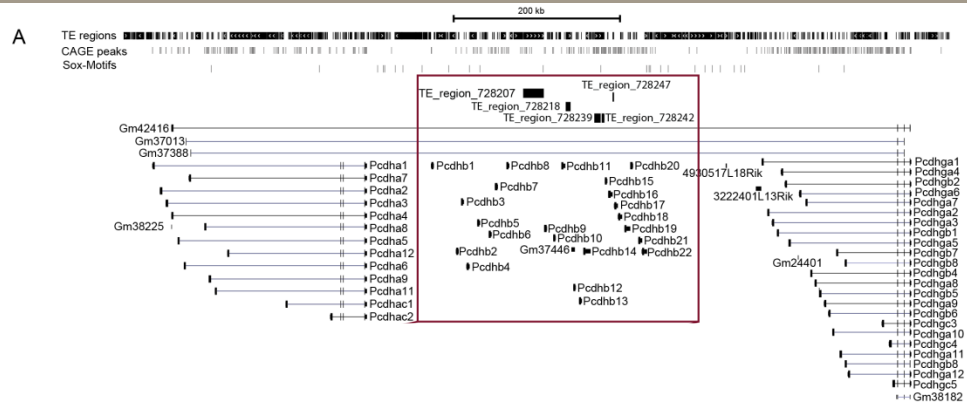

- Strong enrichment of Sox5 motif in brain
- Clear correlation of TSS occurrence with Sox5 motif

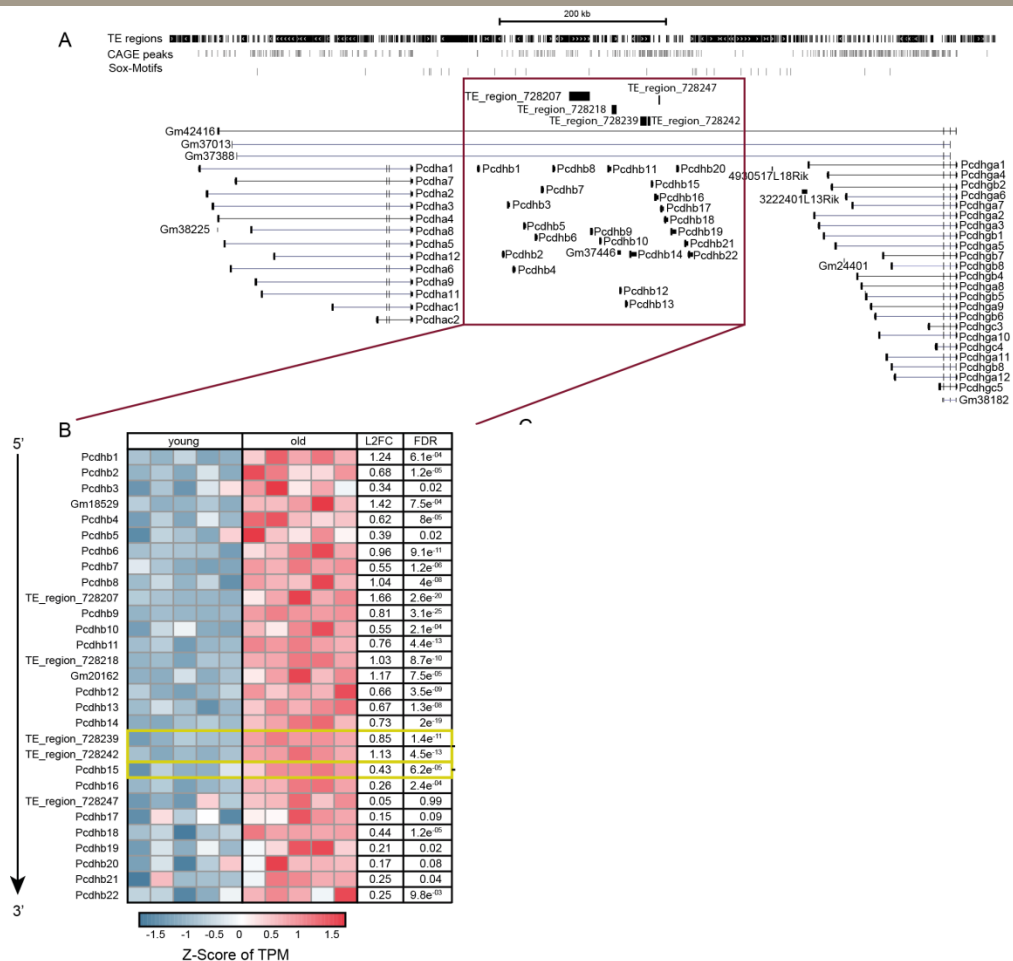

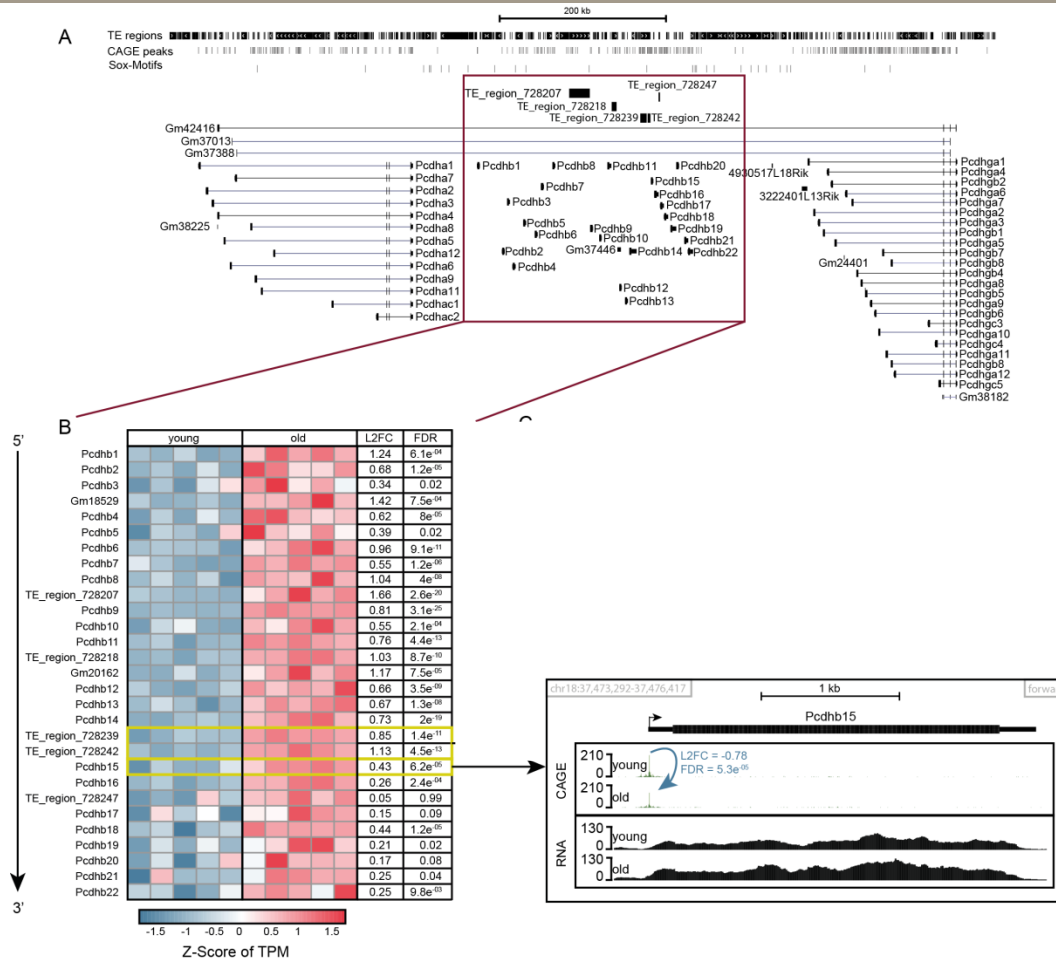

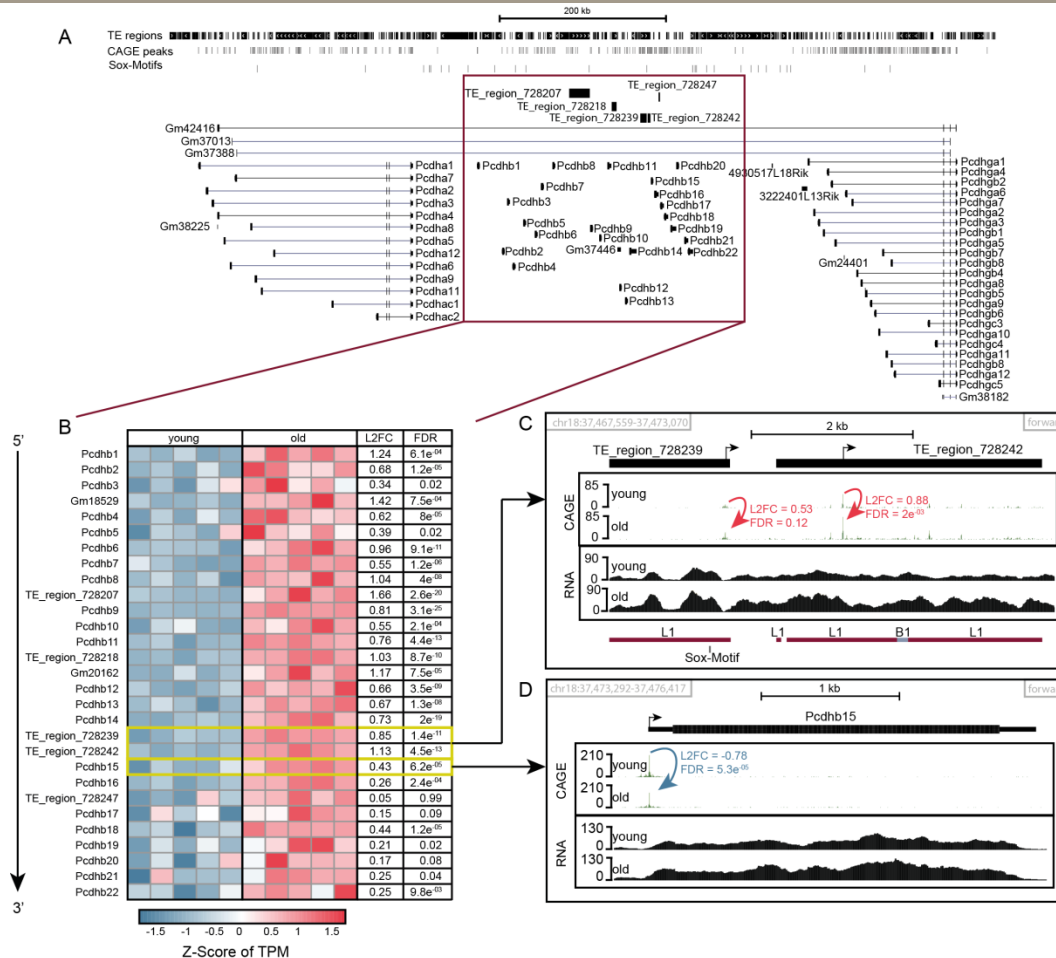

- Expression quantification of individual TEs works quite well
- Genome-wide, copy-specific TE expression signature of aging mice
- Identification of independently expressed TE regions via CAGE
- Sox5 associated TSS in 3'end of L1 subfamilies in brain
- Strong association of independent TEs with synaptic functions
- Potential effects on neuronal aging
