RNA Secondary Structures in Dijon

Dijon, 24.– 26.06.2002

No new principle will declare
itself from below a heap of
facts.

Sir Peter Medawar, 1985

The **genotypes** or **genomes** of individuals and species, being reproductively related ensembles of individuals, are DNA or RNA sequences. They are changing from generation to generation through mutation and recombination.

Genotypes unfold into **phenotypes** or organisms, which are the targets of the evolutionary selection process.

Point mutations are single nucleotide exchanges. The **Hamming distance** of two sequences is the minimal number of single nucleotide exchanges that mutually converts the two sequence into each other.

A = adenylate

U = uridylate

C = cytidylate

G = guanylate

Genotype: The sequence of an RNA molecule consisting of monomers chosen from four classes.

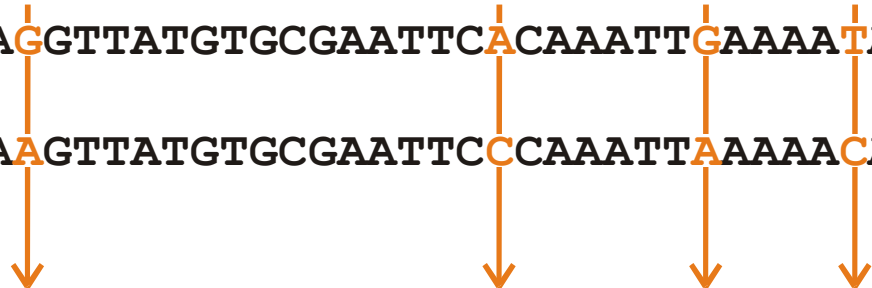

Phenotype: Three-dimensional structure of phenylalanyl transfer-RNA

Definition and formation of the secondary structure of phenylalanyl-tRNA

S_1 : CGTCGTTACAATTTA**G**GTTATGTGCGAATTC**A**CAAATT**G**AAAA**T**ACAAGAG
 S_2 : CGTCGTTACAATTTA**A**GTTATGTGCGAATTC**C**CAAATT**A**AAAA**C**ACAAGAG

Hamming distance $d_H(S_1, S_2) = 4$

- (i) $d_H(S_1, S_1) = 0$
- (ii) $d_H(S_1, S_2) = d_H(S_2, S_1)$
- (iii) $d_H(S_1, S_3) < d_H(S_1, S_2) + d_H(S_2, S_3)$

The Hamming distance induces a metric in sequence space

Hydrogen bonds

Hydrogen bonding between nucleotide bases is the principle of template action of RNA and DNA.

Complementary replication as the simplest copying mechanism of RNA

$$dx_j / dt = f_j x_j - x_j \Phi = (f_j - \Phi) x_j$$

$$\Phi = \sum_i f_i x_i ; \quad \sum_i x_i = 1 ; \quad i, j = 1, 2, \dots, n$$

$$[A] = a = \text{constant}$$

$$f_m = \max \{f_j; j=1, 2, \dots, n\}$$

$$x_m(t) \xrightarrow{t \rightarrow \infty} 1$$

$$s = (f_{m+1} - f_m) / f_m$$

succession of temporarily

fittest variants:

$$m \xrightarrow{t} m+1 \xrightarrow{t} \dots$$

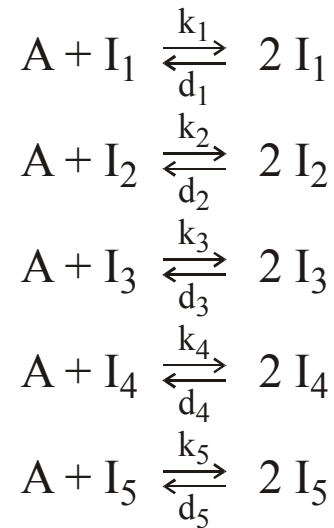

Selection of the „fittest“ or fastest replicating species I_m

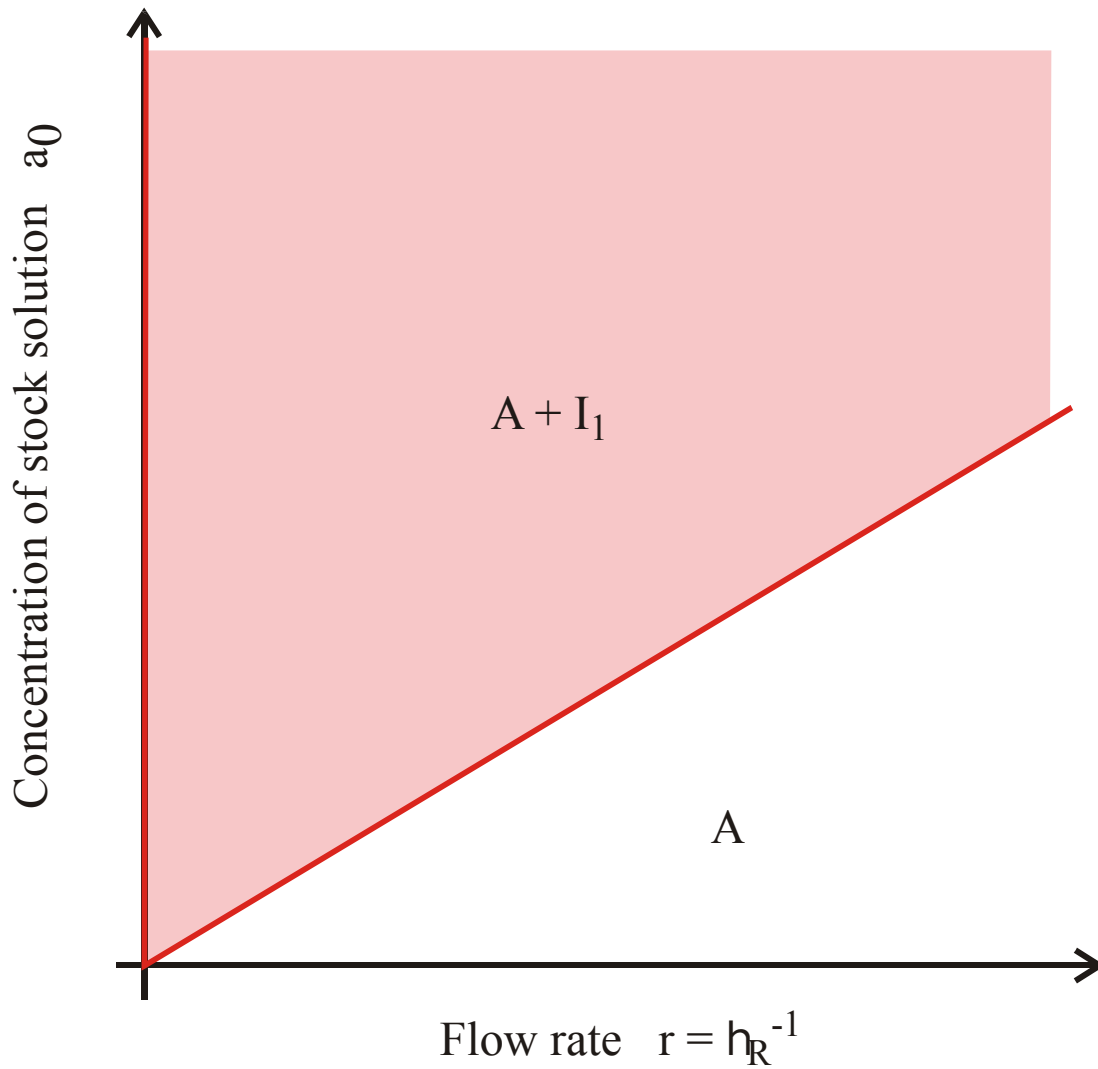

Replication in the flow reactor

P.Schuster & K.Sigmund, Dynamics of evolutionary optimization, *Ber.Bunsenges.Phys.Chem.* **89**: 668-682 (1985)

$$k_1 > k_2 > k_3 > k_4 > k_5$$

Selection in the flow reactor: Reversible replication reactions

$$f_1 > f_2 > f_3 > f_4 > f_5$$

Selection in the flow reactor: Irreversible replication reactions

Selection of advantageous mutants in populations of $N = 10\,000$ individuals

$$dx_j / dt = \sum_i f_i Q_{ji} x_i - x_j \Phi$$

$$\Phi = \sum_i f_i x_i ; \quad \sum_i x_i = 1 ; \quad \sum_i Q_{ij} = 1$$

$$Q_{ij} = (1-p)^{n-d(i,j)} p^{d(i,j)}$$

p Error rate per digit

d(i,j) Hamming distance
between I_i and I_j

[A] = a = constant

Chemical kinetics of replication and mutation

The molecular quasispecies in sequence space

The **RNA model** considers RNA sequences as genotypes and simplified RNA structures, called secondary structures, as phenotypes.

The **mapping** from genotypes into phenotypes is many-to-one. Hence, it is redundant and not invertible.

Genotypes, i.e. RNA sequences, which are mapped onto the same phenotype, i.e. the same RNA secondary structure, form **neutral networks**. Neutral networks are represented by graphs in sequence space.

Mapping from sequence space into phenotype space and into fitness values

A multi-component neutral network

A connected neutral network

44

Three important steps in the formation of the tRNA clover leaf from a randomly chosen initial structure corresponding to three [main transitions](#).

Main results of computer simulations of molecular evolution

- No trajectory was reproducible in detail. Sequences of target structures were different. Nevertheless solutions of comparable or the same quality are almost always achieved.
- Transitions between molecular phenotypes represented by RNA structures can be classified with respect to the induced structural changes. Highly probable **minor transitions** are opposed by **main transitions** with low probability of occurrence.
- **Main transitions** represent important **innovations** in the course of evolution.
- The number of **minor transitions** decreases with increasing population size.
- The number of **main transitions** or evolutionary innovations is approximately constant for given start and stop structures.
- Not all structures are accessible through evolution in the flow reactor. An example is the tRNA clover leaf for GC-only sequences.

„...Variations neither useful not injurious would not be affected by natural selection, and would be left either a fluctuating element, as perhaps we see in certain polymorphic species, or would ultimately become fixed, owing to the nature of the organism and the nature of the conditions.
...“
