correct replication

Taq-polymerase

adenine 

thymine 

mutation

p mutation rate per site
and replication

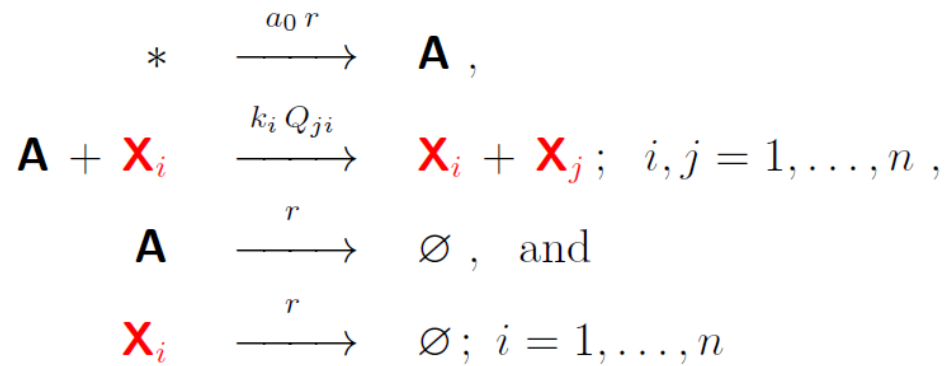

guanine 

cytosine 

DNA replication and mutation

The continuously fed stirred tank reactor (CFSTR)

quasispecies in the
flow reactor

$$[\mathbf{A}] = a \quad \text{and} \quad [\mathbf{X}_j] = x_j ; \quad j = 1, \dots, n$$

$$\frac{da}{dt} = -a \left(\sum_{j=1}^n k_j x_j + r \right) + a_0 r$$

$$\frac{dx_j}{dt} = \left(\sum_{i=1}^n Q_{ji} k_i x_i \right) a - x_j r ; \quad j = 1, \dots, n$$

stationary solutions: (i) $\bar{a} = \bar{c}_0$, $\bar{x}_j = 0$; $c_0 = \sum_{j=1}^n x_j$; $j = 1, \dots, n$

$$(ii) \left(\sum_{i=1}^n Q_{ji} k_i \bar{x}_i \right) \bar{a} - \bar{x}_j r = 0 ; \quad j = 1, \dots, n$$

Manfred Eigen
1927 -

$$\frac{dx_j}{dt} = \sum_{i=1}^n W_{ji} x_i - x_j \Phi; \quad j = 1, 2, \dots, n$$

$$W_{ji} = Q_{ji} \cdot f_i, \quad \sum_{i=1}^n x_i = 1, \quad \Phi = \sum_{i=1}^n f_i x_i$$

fitness landscape

mutation matrix

Mutation and (correct) replication as parallel chemical reactions

M. Eigen. 1971. *Naturwissenschaften* 58:465,

M. Eigen & P. Schuster. 1977-78. *Naturwissenschaften* 64:541, 65:7 und 65:341

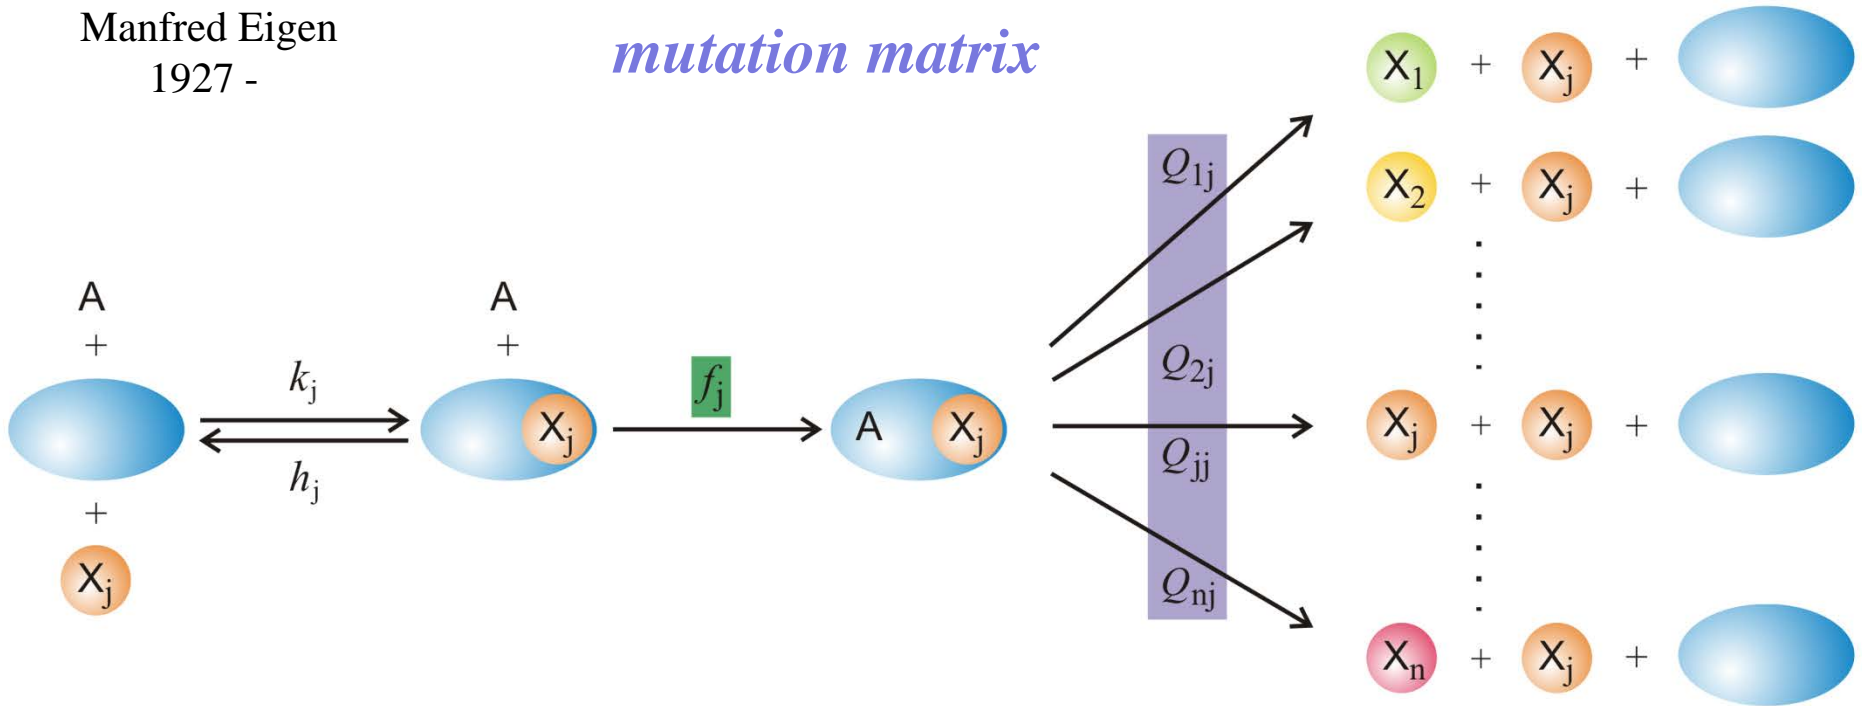

Manfred Eigen
1927 -

$$\frac{dx_j}{dt} = \sum_{i=1}^n W_{ji} x_i - x_j \Phi; \quad j = 1, 2, \dots, n$$

$$W_{ji} = Q_{ji} \cdot f_i, \quad \sum_{i=1}^n x_i = 1, \quad \Phi = \sum_{i=1}^n f_i x_i$$

fitness landscape

mutation matrix

Mutation and (correct) replication as parallel chemical reactions

M. Eigen. 1971. *Naturwissenschaften* 58:465,

M. Eigen & P. Schuster. 1977-78. *Naturwissenschaften* 64:541, 65:7 und 65:341

$$\frac{dx_j}{dt} = (f_j - \overline{f(t)}) x_j + \sum_{j=1}^N \mu_{ji} x_j \quad \text{or} \quad \frac{dx}{dt} = (F + \mu - \overline{f(t)}) x$$

paramuse – parallel mutation and selection model:

Ellen Baake, Michael Baake, Holger Wagner. 2001. *Ising quantum chain is equivalent to a model of biological evolution*. Phys.Rev.Letters 78:559-562.

James F. Crow and Motoo Kimura. 1970. *An introduction into population genetics theory*. Harper & Row, New York. Reprinted at the Blackburn Press, Cladwell, NJ, 2009, p.265.

The Crow-Kimura model of replication and mutation

$$Q = \begin{pmatrix} q^3 & p & p & p & p^2 & p^2 & p^2 & p^3 \\ p & q^3 & p^2 & p^2 & p & p & p^3 & p^2 \\ p & p^2 & q^3 & p^2 & p & p^3 & p & p^2 \\ p & p^2 & p^2 & q^3 & p^3 & p & p & p^2 \\ p^2 & p & p & p^3 & q^3 & p^2 & p^2 & p \\ p^2 & p & p^3 & p & p^2 & q^3 & p^2 & p \\ p^2 & p^3 & p & p & p^2 & p^2 & q^3 & p \\ p^3 & p^2 & p^2 & p^2 & p & p & p & q^3 \end{pmatrix}$$

$$q^3 = (1 - p)^3$$

$$Q: \sum_{i=1}^N Q_{ij} = 1; j = 1, \dots, N$$

$$W = Q \cdot F$$

$$\mu = \begin{pmatrix} -3\gamma & \gamma & \gamma & \gamma & 0 & 0 & 0 & 0 \\ \gamma & -3\gamma & 0 & 0 & \gamma & \gamma & 0 & 0 \\ \gamma & 0 & -3\gamma & 0 & \gamma & 0 & \gamma & 0 \\ \gamma & 0 & 0 & -3\gamma & 0 & \gamma & \gamma & 0 \\ 0 & \gamma & \gamma & 0 & -3\gamma & 0 & 0 & \gamma \\ 0 & \gamma & 0 & \gamma & 0 & -3\gamma & 0 & \gamma \\ 0 & 0 & \gamma & \gamma & 0 & 0 & -3\gamma & \gamma \\ 0 & 0 & 0 & 0 & \gamma & \gamma & \gamma & -3\gamma \end{pmatrix}$$

$$\mu: \sum_{i=1}^N \mu_{ij} = 0; j = 1, \dots, N$$

$$W = \mu + F$$

The mutation matrix in the quasispecies and the Crow-Kimura model

Integrating factor transformation: $z_j(t) = x_j(t) \cdot \exp\left(\int_0^t \bar{f}(\tau) d\tau\right) ; j = 1, \dots, N$

Eigenvalue problem: $\Lambda = H \cdot W \cdot H^{-1} = H \cdot W \cdot B$

$$\Lambda = \{\Lambda_{ii} = \lambda_i \ i = 1, \dots, N\}, H = \{h_{ij}\}, H^{-1} = B = \{b_{ij}\}$$

$$H \cdot W = \Lambda \cdot H, \mathbf{h}_k = (h_{ki}, i = 1, \dots, N) \text{ and}$$

$$W \cdot B = B \cdot \Lambda, \mathbf{b}_j = (b_{ij}, i = 1, \dots, N)^t$$

Solution:

$$\begin{aligned} x_j(t) &= \frac{\sum_{k=1}^N b_{jk} \sum_{l=1}^N h_{kl} x_l(0) \exp(\lambda_k t)}{\sum_{i=1}^N \sum_{k=1}^N b_{ik} \sum_{l=1}^N h_{kl} x_l(0) \exp(\lambda_k t)} = \\ &= \frac{\sum_{k=1}^N b_{jk} \beta_k(0) \exp(\lambda_k t)}{\sum_{i=1}^N \sum_{k=1}^N b_{ik} \beta_k(0) \exp(\lambda_k t)} \quad \text{with} \quad \beta_k(0) = \sum_{l=1}^N h_{kl} x_l(0) \end{aligned}$$

Solution of the quasispecies equation

Largest eigenvalue λ_1 and corresponding eigenvector \mathbf{b}_1 :

$$x_j(t) \approx \frac{b_{j1} \beta_1(0) \exp(\lambda_1 t)}{\sum_{i=1}^N b_{i1} \beta_1(0) \exp(\lambda_1 t)} = \frac{b_{j1}}{\sum_{i=1}^N b_{i1}} = \bar{x}_j \text{ for large } t$$

master sequence: \mathbf{X}_m at concentration \bar{x}_m

mutant cloud: \mathbf{X}_j at concentration \bar{x}_j ; $j=1, \dots, N$; $j \neq m$

Stationary solution of the quasispecies equation

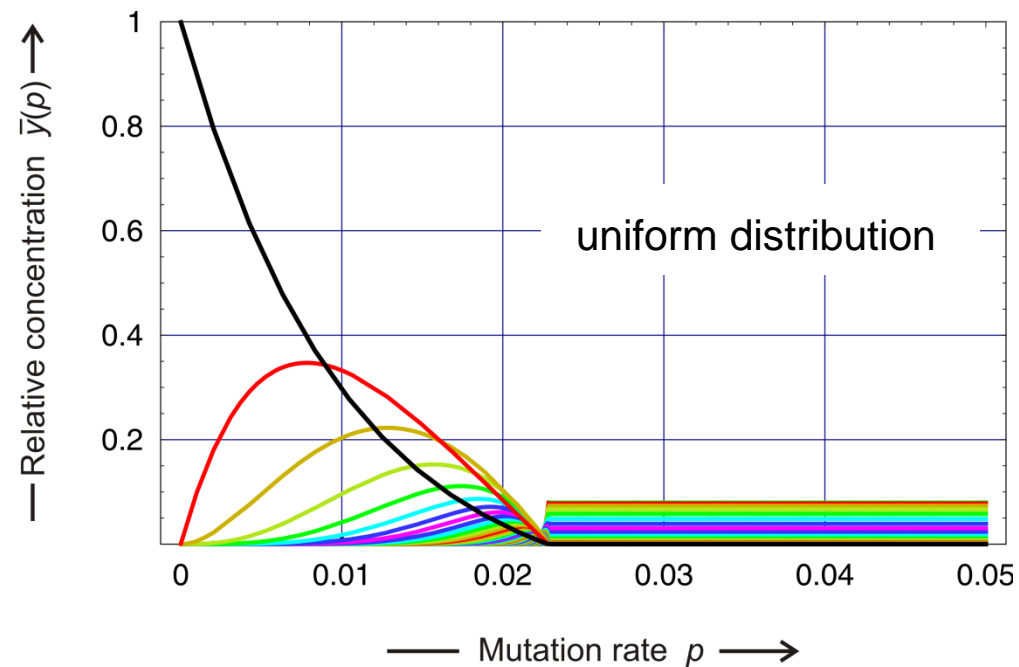

single peak landscape

A simple model fitness landscapes

$$l = 100, f_m = 10, f = 1, \\ \sigma_m = 10$$

error threshold on the
single peak landscape

phenomenological approach (Eigen, M., Naturwissenschaften 1971)

(i) zero mutational backflow (non consistently applied)

(ii) uniform error rate: p is independent of nature and position of nucleotide

$$Q_{ij} = \varepsilon^{d_{ij}^{(H)}} Q \quad \text{with} \quad \varepsilon = \frac{p}{1-p} \quad \text{and} \quad Q = (1-p)^l$$

and $d_{ij}^{(H)}$ is the Hamming distance between \mathbf{X}_i and \mathbf{X}_j .

(iii) single peak landscape: $f_m = f_0, f_j = f \quad \forall j \neq m$

phenomenological approximation to the quasispecies equation

The error threshold in replication and mutation

$$\Pi(t) = x_1(t)\mathbf{X}_1 \oplus x_2(t)\mathbf{X}_2 \oplus \dots \oplus x_n(t)\mathbf{X}_n$$

$$\lim_{t \rightarrow \infty} \Pi(t) = \bar{\Upsilon} = \bar{x}_1\mathbf{X}_1 \oplus \bar{x}_2\mathbf{X}_2 \oplus \dots \oplus \bar{x}_n\mathbf{X}_n$$

continuous quasispecies

$$\tilde{\Upsilon} = \bar{\eta}_1\mathbf{Y}_1 \oplus \bar{\eta}_2\mathbf{Y}_2 \oplus \dots \oplus \bar{\eta}_n\mathbf{Y}_n \quad \text{with} \quad \bar{\eta}_i = \begin{cases} \lfloor \bar{x}_i \rfloor & \text{if } \bar{x}_i \geq 1 \\ 0 & \text{if } \bar{x}_i < 1 \end{cases}$$

discrete quasispecies

$$\hat{x}_m = \frac{Q - \sigma_m^{-1}}{1 - \sigma_m^{-1}} \hat{c}_0 \quad \text{and}$$

$$\hat{x}_j = \varepsilon^{d_{mj}^{(H)}} \frac{Q - \sigma_m^{-1}}{(1 - \sigma_m^{-1})^2} \hat{c}_0, \quad j \neq m$$

phenomenological approximation

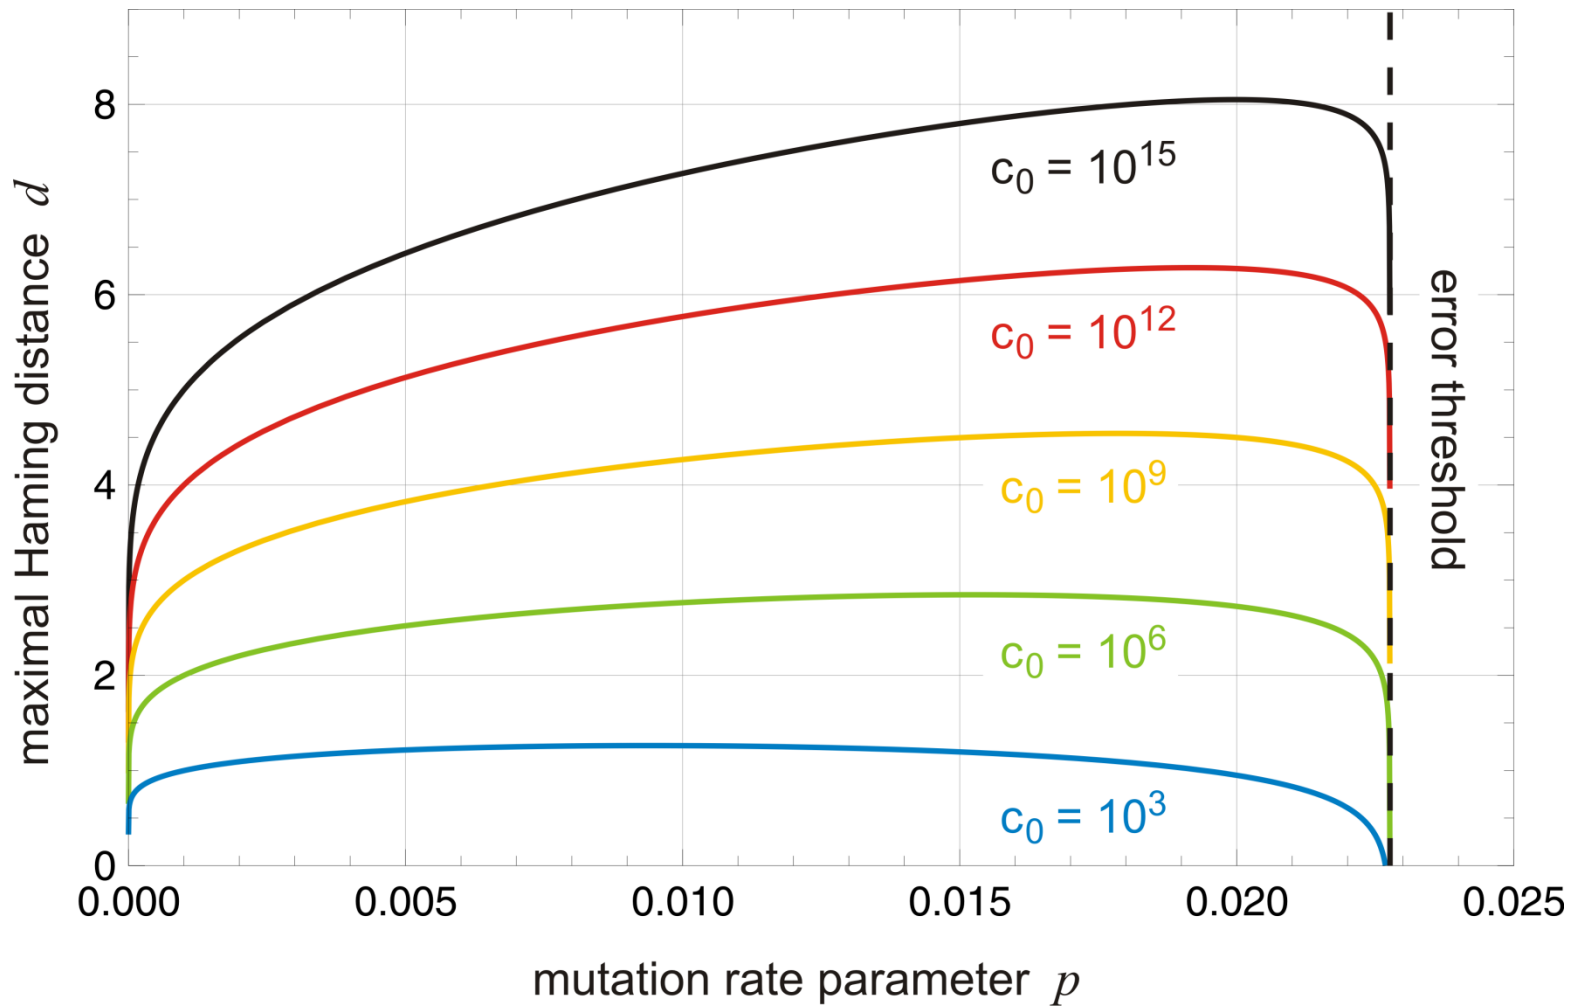

$$\hat{x}_j \geq k \implies d \leq \frac{1}{\log \varepsilon} \log \frac{k(1 - \sigma_m^{-1})^2}{(Q - \sigma_m^{-1}) \hat{c}_0}$$

discreteness condition

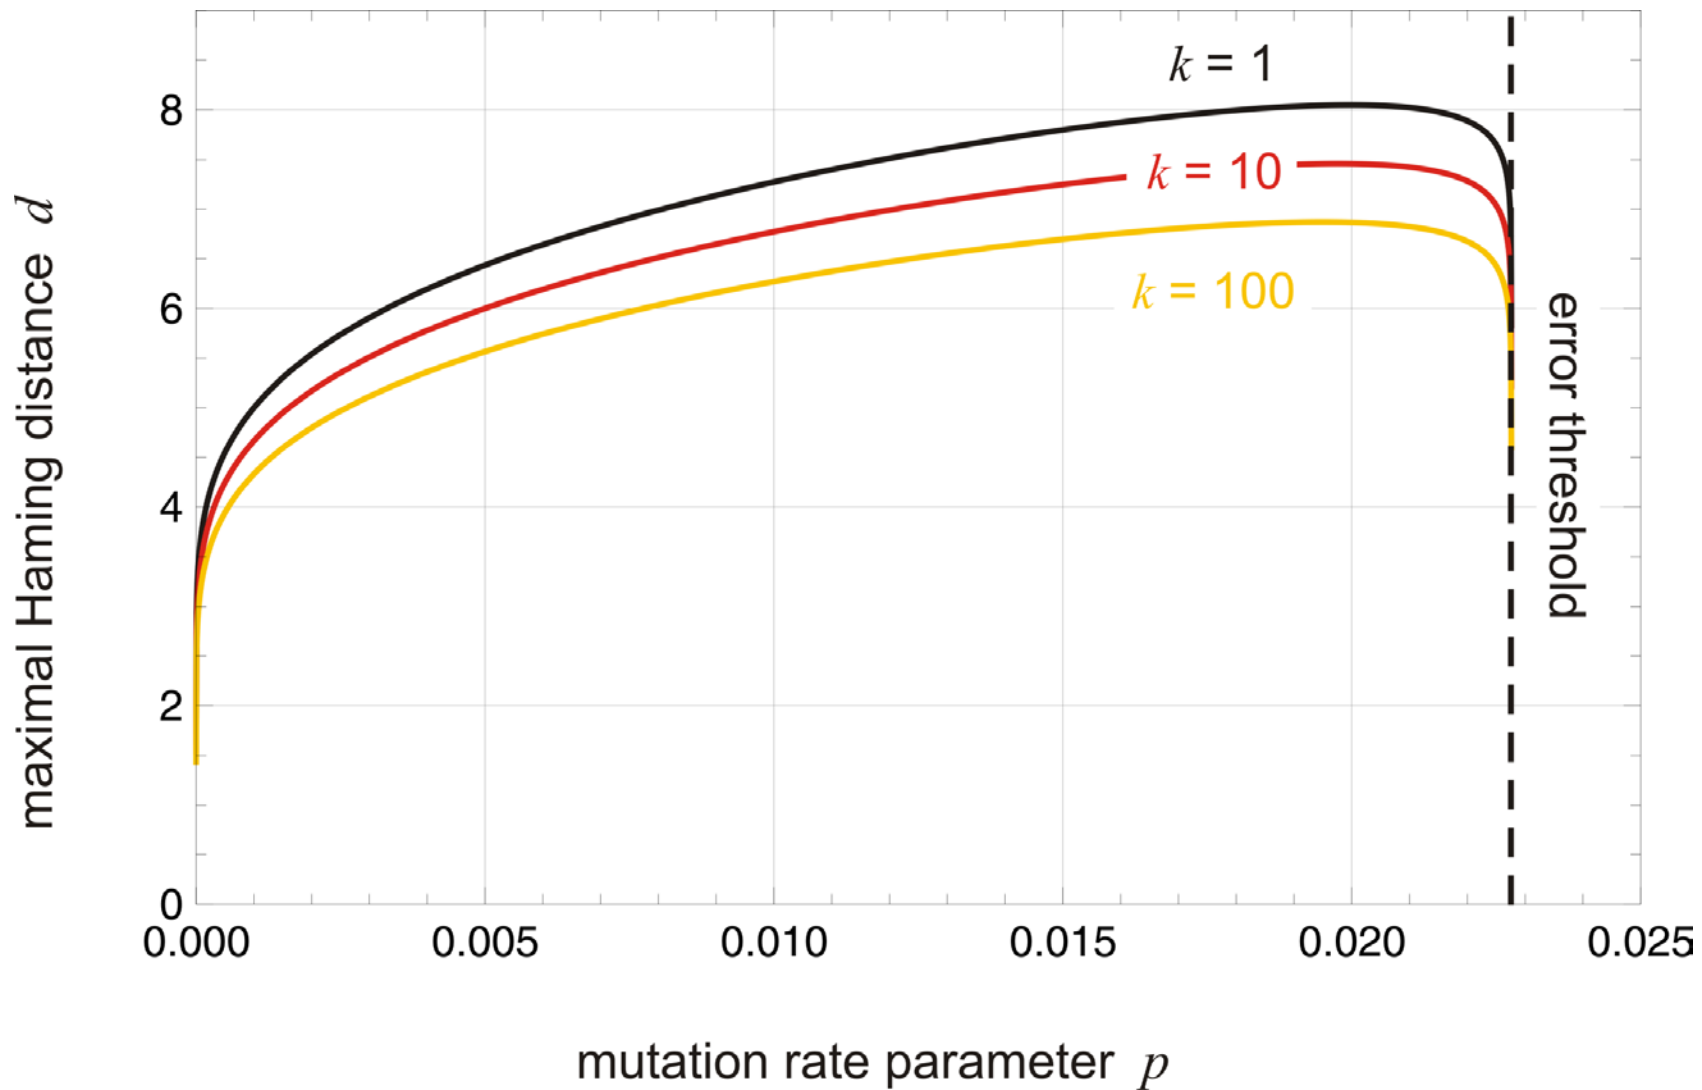

width of the discrete quasispecies: $2d$

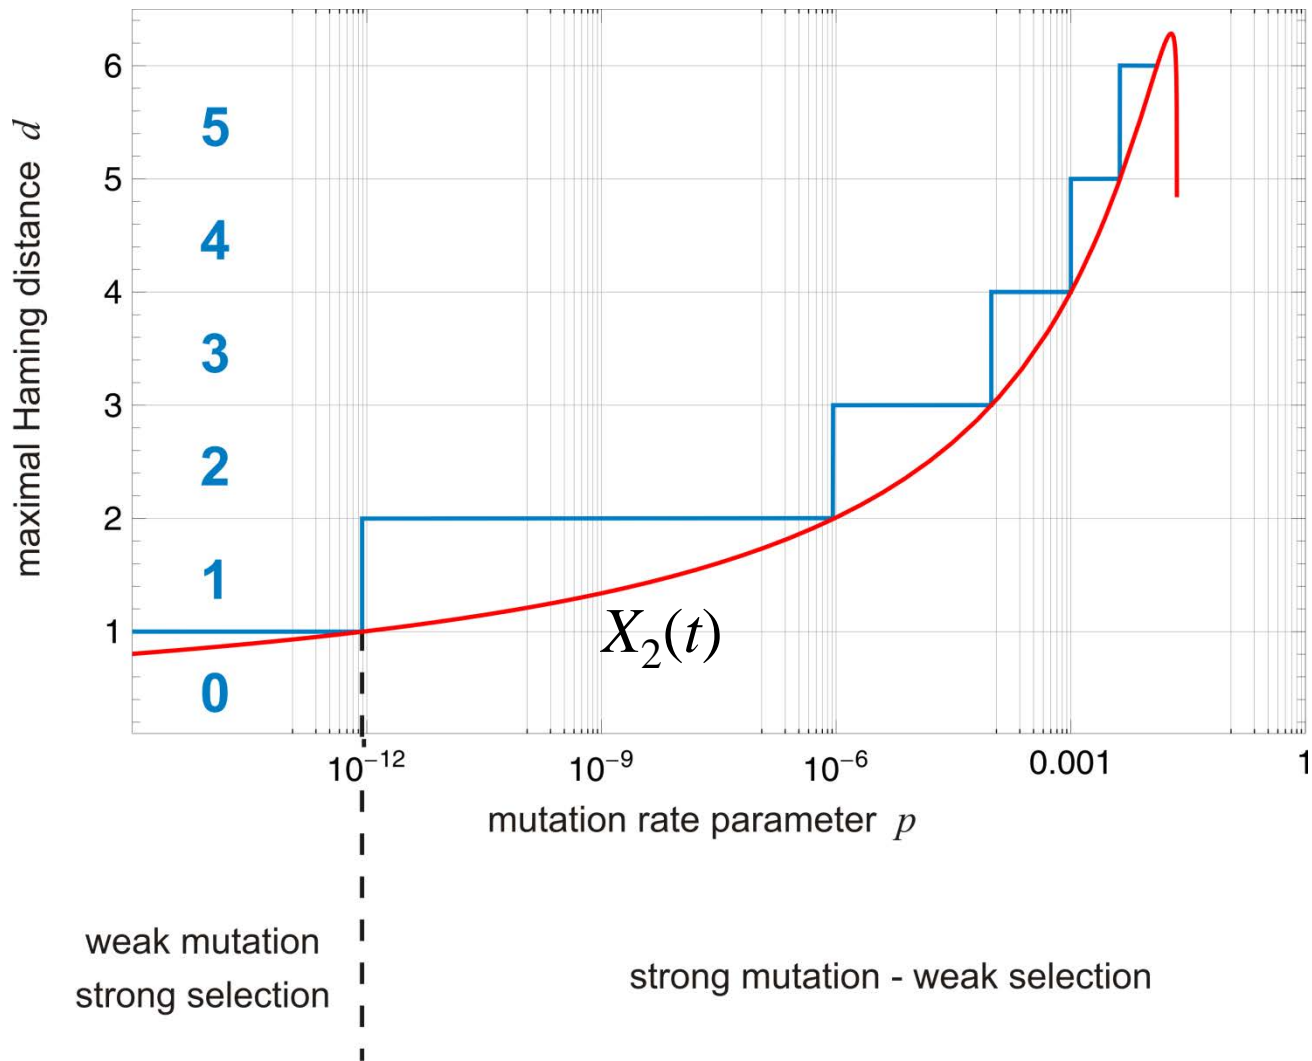

discrete quasispecies: $c_0 = 10^{12}$, $l = 100$, $k = 1$

discrete quasispecies: $l = 100, k = 1$

discrete quasispecies: $c_0 = 10^{12}$, $l = 100$

width of the discrete quasispecies

$$P_m(t) = \text{Prob} \left(A(t) = m \right) \quad \text{and} \quad P_{s_i}(t) = \text{Prob} \left(X_i(t) = s_i \right)$$

$$\mathbf{m} = (m, s_1, \dots, s_n)$$

$$\begin{aligned} \frac{dP_{\mathbf{m}}}{dt} = & a_0 r \left(P_{(\mathbf{m}; m-1)} - P_{\mathbf{m}} \right) + r \left((m+1) P_{(\mathbf{m}; m+1)} - m P_{\mathbf{m}} \right) + \\ & + r \sum_{i=1}^n \left((s_i + 1) P_{(\mathbf{m}; s_i+1)} - s_i P_{\mathbf{m}} \right) + \\ & + \sum_{i=1}^n Q_{ii} k_i \left((m+1)(s_i - 1) P_{(\mathbf{m}; m+1, s_i-1)} - m s_i P_{\mathbf{m}} \right) + \\ & + \sum_{i=1}^n \sum_{j=1, j \neq i}^n Q_{ij} k_j s_j \left((m+1) P_{(\mathbf{m}; m+1, s_i-1)} - m P_{\mathbf{m}} \right) \end{aligned}$$

$$\mathbf{m} = (m, s_1, \dots, s_n) \quad \begin{array}{l} \mathbf{m}' = (m \pm 1, s_1, \dots, s_n) \equiv (\mathbf{m}; m \pm 1) \quad \text{or} \\ \mathbf{m}' = (m, s_1, \dots, s_k \pm 1, \dots, s_n) \equiv (\mathbf{m}; s_k \pm 1) \end{array}$$

jumps: $S_{\mathbf{m}} \rightarrow S_{\mathbf{m}}$, and $S_{\mathbf{m}'} \rightarrow S_{\mathbf{m}}$

mutation scheme *pentagram* for $n = 5$

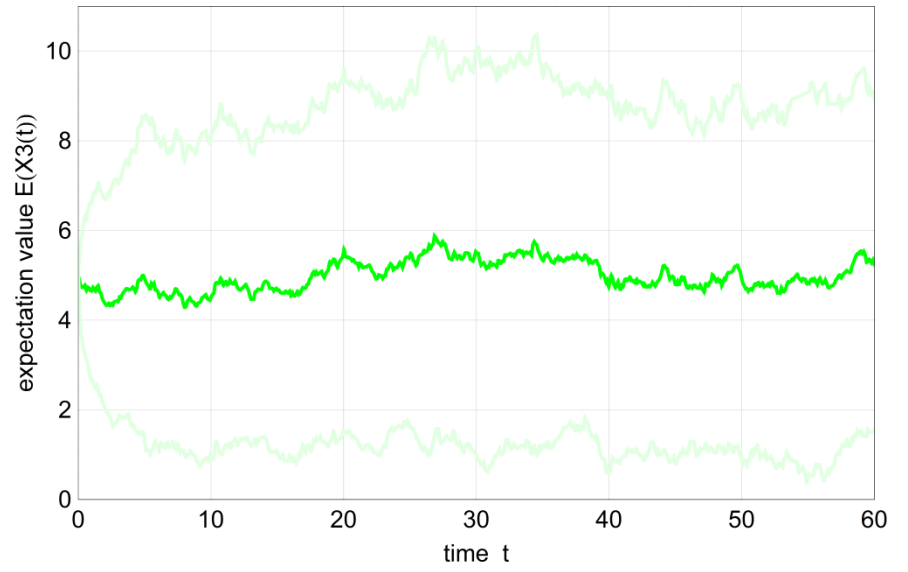

statistics of 100 trajectories:

$N = 2000$, $k = 5$, $p = 0.0124$;
flow reactor: $r = 0.5$;
 $k_1 = 0.150$, $k_2 = k_5 = 0.0125$,
 $k_3 = k_4 = 0.100$

one standard deviation band:

resource A, master sequence X_1

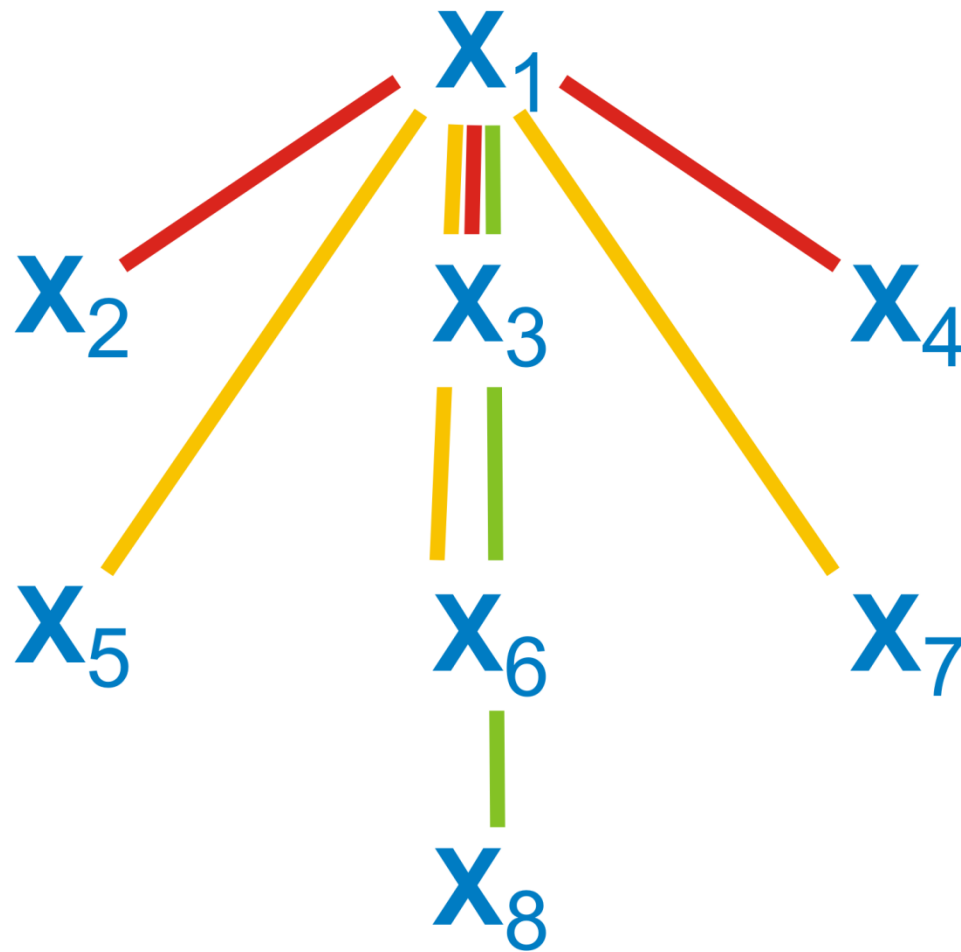

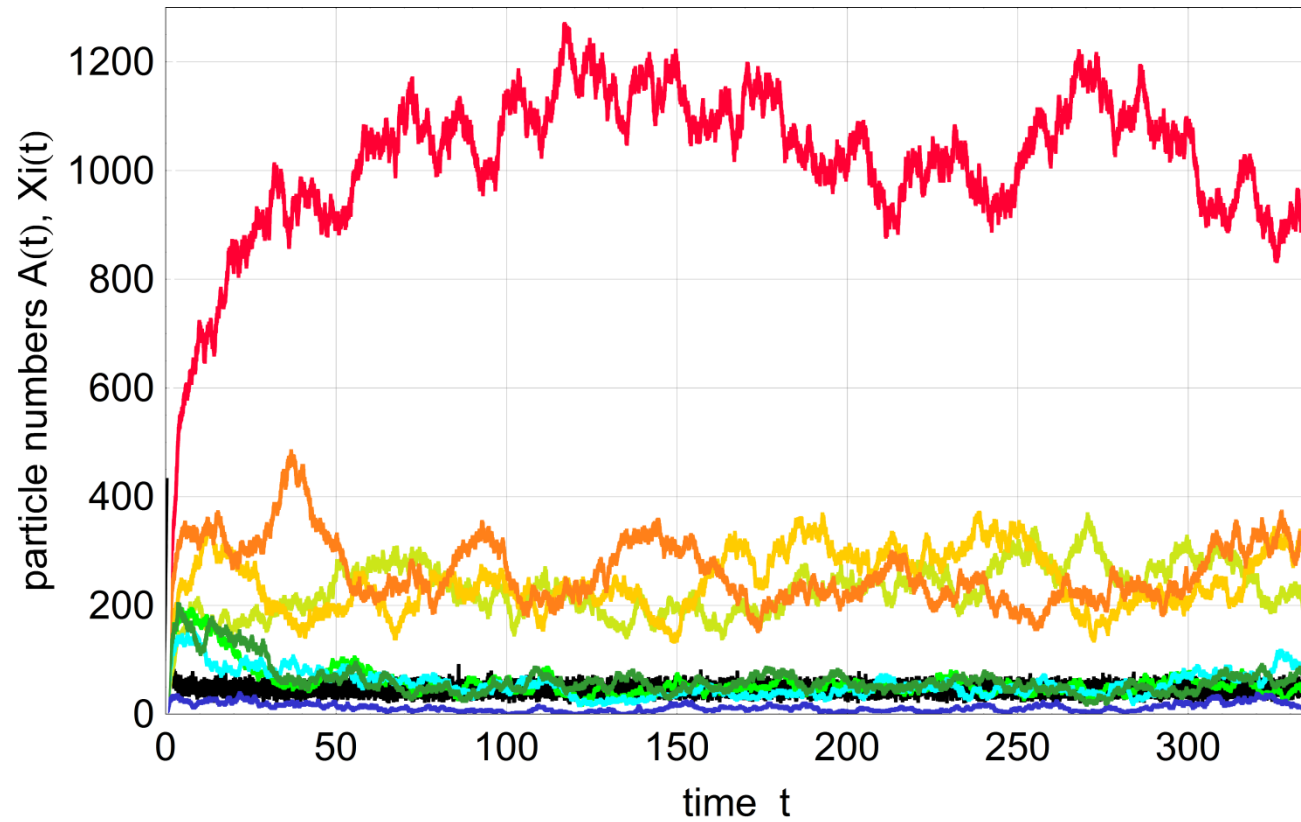

one standard deviation bands: mutants

	deterministic	expectation E	standard dev. σ	\sqrt{E}
$A(t)$	3.413	3.424	1.843	1.850
$X_1(t)$	1727.9	1720	54.68	41.47
$X_2(t)$	129.31	133.2	27.69	11.54
$X_3(t)$	5.0298	5.132	3.945	2.265
$X_4(t)$	5.0298	5.200	4.215	2.280
$X_5(t)$	129.31	132.1	25.59	11.49

$N = 2000$, $k = 5$, $p = 0.0124$; flow reactor: $r = 0.5$; $k_1 = 0.150$, $k_2 = k_5 = 0.125$, $k_3 = k_4 = 0.100$

mutation scheme *sequence space* for $l = 3$ ($n = 8$)

Gillespie simulation of stochastic quasispecies $l = 3$
