<b>1</b>	<b>ViennaRNA Package core - RNAlib</b>	<b>1</b>
1.1	Introduction . . . . .	1
<b>2</b>	<b>Parsing and Comparing - Functions to Manipulate Structures</b>	<b>3</b>
<b>3</b>	<b>Utilities - Odds and Ends</b>	<b>7</b>
3.1	Producing secondary structure graphs . . . . .	7
3.2	Producing (colored) dot plots for base pair probabilities . . . . .	8
3.3	Producing (colored) alignments . . . . .	9
3.4	RNA sequence related utilities . . . . .	9
3.5	RNA secondary structure related utilities . . . . .	9
3.6	Miscellaneous Utilities . . . . .	10
<b>4</b>	<b>Example - A Small Example Program</b>	<b>13</b>
<b>5</b>	<b>Deprecated List</b>	<b>15</b>
<b>6</b>	<b>Module Index</b>	<b>17</b>
6.1	Modules . . . . .	17
<b>7</b>	<b>Data Structure Index</b>	<b>19</b>
7.1	Data Structures . . . . .	19
<b>8</b>	<b>File Index</b>	<b>21</b>
8.1	File List . . . . .	21
<b>9</b>	<b>Module Documentation</b>	<b>25</b>
9.1	RNA Secondary Structure Folding . . . . .	25
9.1.1	Detailed Description . . . . .	27
9.2	Calculating Minimum Free Energy (MFE) Structures . . . . .	28
9.2.1	Detailed Description . . . . .	28
9.2.2	Function Documentation . . . . .	29
9.2.2.1	fold_par . . . . .	29
9.2.2.2	fold . . . . .	30

9.2.2.3	circfold	30
9.3	Calculating Partition Functions and Pair Probabilities	31
9.3.1	Detailed Description	32
9.3.2	Function Documentation	32
9.3.2.1	pf_fold_par	32
9.3.2.2	pf_fold	33
9.3.2.3	pf_circ_fold	34
9.3.2.4	free_pf_arrays	35
9.3.2.5	update_pf_params	35
9.3.2.6	export_bppm	35
9.3.2.7	assign_plist_from_pr	36
9.3.2.8	get_pf_arrays	36
9.3.2.9	mean_bp_distance	36
9.3.2.10	mean_bp_distance_pr	37
9.4	Compute the structure with maximum expected accuracy (MEA)	38
9.5	Compute the centroid structure	39
9.5.1	Detailed Description	39
9.5.2	Function Documentation	39
9.5.2.1	get_centroid_struct_pl	39
9.5.2.2	get_centroid_struct_pr	39
9.6	Enumerating Suboptimal Structures	41
9.6.1	Detailed Description	41
9.7	Suboptimal structures according to Zuker et al. 1989	42
9.7.1	Detailed Description	42
9.7.2	Function Documentation	42
9.7.2.1	zukersubopt	42
9.8	Suboptimal structures within an energy band around the MFE	43
9.8.1	Detailed Description	43
9.8.2	Function Documentation	43
9.8.2.1	subopt	43
9.8.2.2	subopt_circ	44
9.9	Stochastic backtracking in the Ensemble	45
9.9.1	Detailed Description	45
9.9.2	Function Documentation	45
9.9.2.1	pbacktrack	45
9.9.2.2	pbacktrack_circ	46
9.9.3	Variable Documentation	46
9.9.3.1	st_back	46
9.10	Calculate Secondary Structures of two RNAs upon Dimerization	47
9.10.1	Detailed Description	47

9.11 MFE Structures of two hybridized Sequences	48
9.11.1 Detailed Description	48
9.11.2 Function Documentation	48
9.11.2.1 cofold	48
9.11.2.2 export_cofold_arrays_gq	49
9.11.2.3 export_cofold_arrays	49
9.12 Partition Function for two hybridized Sequences	50
9.12.1 Detailed Description	51
9.12.2 Function Documentation	51
9.12.2.1 co_pf_fold	51
9.12.2.2 co_pf_fold_par	51
9.12.2.3 export_co_bppm	52
9.12.2.4 update_co_pf_params	52
9.12.2.5 update_co_pf_params_par	52
9.12.2.6 compute_probabilities	53
9.12.2.7 get_concentrations	53
9.13 Partition Function for two hybridized Sequences as a stepwise Process	54
9.13.1 Detailed Description	54
9.13.2 Function Documentation	54
9.13.2.1 pf_unstru	54
9.13.2.2 pf_interact	55
9.14 Predicting Consensus Structures from Alignment(s)	56
9.14.1 Detailed Description	57
9.14.2 Function Documentation	57
9.14.2.1 get_mpi	57
9.14.2.2 energy_of_alistruct	57
9.14.2.3 encode_ali_sequence	58
9.14.2.4 alloc_sequence_arrays	58
9.14.2.5 free_sequence_arrays	58
9.14.2.6 get_alipf_arrays	59
9.14.3 Variable Documentation	59
9.14.3.1 cv_fact	59
9.14.3.2 nc_fact	59
9.15 MFE Consensus Structures for Sequence Alignment(s)	60
9.15.1 Detailed Description	60
9.15.2 Function Documentation	60
9.15.2.1 alifold	60
9.15.2.2 circalifold	60
9.16 Partition Function and Base Pair Probabilities for Sequence Alignment(s)	62
9.16.1 Detailed Description	62

9.16.2	Function Documentation	62
9.16.2.1	alipf_fold_par	62
9.16.2.2	alipf_fold	62
9.16.2.3	alipf_circ_fold	63
9.16.2.4	export_ali_bppm	63
9.17	Stochastic Backtracking of Consensus Structures from Sequence Alignment(s)	64
9.17.1	Detailed Description	64
9.17.2	Function Documentation	64
9.17.2.1	alipbacktrack	64
9.18	Predicting Locally stable structures of large sequences	65
9.18.1	Detailed Description	65
9.19	Local MFE structure Prediction and Z-scores	66
9.19.1	Detailed Description	66
9.19.2	Function Documentation	66
9.19.2.1	Lfold	66
9.19.2.2	Lfoldz	66
9.20	Partition functions for locally stable secondary structures	67
9.20.1	Detailed Description	67
9.20.2	Function Documentation	67
9.20.2.1	update_pf_paramsLP	67
9.20.2.2	pfl_fold	67
9.20.2.3	putoutpU_prob	68
9.20.2.4	putoutpU_prob_bin	68
9.21	Local MFE consensus structures for Sequence Alignments	70
9.21.1	Detailed Description	70
9.21.2	Function Documentation	70
9.21.2.1	aliLfold	70
9.22	Change and Precalculate Energy Parameter Sets and Boltzmann Factors	71
9.22.1	Detailed Description	71
9.22.2	Function Documentation	72
9.22.2.1	scale_parameters	72
9.22.2.2	get_scaled_parameters	72
9.22.2.3	get_scaled_pf_parameters	72
9.22.2.4	get_boltzmann_factors	72
9.22.2.5	get_boltzmann_factor_copy	73
9.23	Reading/Writing energy parameter sets from/to File	74
9.23.1	Detailed Description	74
9.23.2	Enumeration Type Documentation	74
9.23.2.1	parset	74
9.23.3	Function Documentation	75

9.23.3.1	read_parameter_file	75
9.23.3.2	write_parameter_file	76
9.24	Converting energy parameter files	77
9.24.1	Detailed Description	78
9.24.2	Macro Definition Documentation	78
9.24.2.1	VRNA_CONVERT_OUTPUT_ALL	78
9.24.2.2	VRNA_CONVERT_OUTPUT_HP	78
9.24.2.3	VRNA_CONVERT_OUTPUT_STACK	78
9.24.2.4	VRNA_CONVERT_OUTPUT_MM_HP	78
9.24.2.5	VRNA_CONVERT_OUTPUT_MM_INT	78
9.24.2.6	VRNA_CONVERT_OUTPUT_MM_INT_1N	78
9.24.2.7	VRNA_CONVERT_OUTPUT_MM_INT_23	78
9.24.2.8	VRNA_CONVERT_OUTPUT_MM_MULTI	78
9.24.2.9	VRNA_CONVERT_OUTPUT_MM_EXT	78
9.24.2.10	VRNA_CONVERT_OUTPUT_DANGLE5	78
9.24.2.11	VRNA_CONVERT_OUTPUT_DANGLE3	79
9.24.2.12	VRNA_CONVERT_OUTPUT_INT_11	79
9.24.2.13	VRNA_CONVERT_OUTPUT_INT_21	79
9.24.2.14	VRNA_CONVERT_OUTPUT_INT_22	79
9.24.2.15	VRNA_CONVERT_OUTPUT_BULGE	79
9.24.2.16	VRNA_CONVERT_OUTPUT_INT	79
9.24.2.17	VRNA_CONVERT_OUTPUT_ML	79
9.24.2.18	VRNA_CONVERT_OUTPUT_MISC	79
9.24.2.19	VRNA_CONVERT_OUTPUT_SPECIAL_HP	79
9.24.2.20	VRNA_CONVERT_OUTPUT_VANILLA	79
9.24.2.21	VRNA_CONVERT_OUTPUT_NINIO	79
9.24.2.22	VRNA_CONVERT_OUTPUT_DUMP	80
9.24.3	Function Documentation	80
9.24.3.1	convert_parameter_file	80
9.25	Energy evaluation	81
9.25.1	Detailed Description	81
9.25.2	Function Documentation	81
9.25.2.1	energy_of_structure	81
9.25.2.2	energy_of_struct_par	82
9.25.2.3	energy_of_circ_structure	82
9.25.2.4	energy_of_circ_struct_par	83
9.25.2.5	energy_of_structure_pt	83
9.25.2.6	energy_of_struct_pt_par	84
9.26	Searching Sequences for Predefined Structures	85
9.26.1	Detailed Description	85

9.26.2	Function Documentation	85
9.26.2.1	inverse_fold	85
9.26.2.2	inverse_pf_fold	86
9.26.3	Variable Documentation	86
9.26.3.1	final_cost	86
9.26.3.2	give_up	86
9.26.3.3	inv_verbose	86
9.27	Classified Dynamic Programming	87
9.27.1	Detailed Description	87
9.28	Distance based partitioning of the Secondary Structure Space	88
9.28.1	Detailed Description	88
9.29	Calculating MFE representatives of a Distance Based Partitioning	89
9.29.1	Detailed Description	89
9.29.2	Function Documentation	89
9.29.2.1	get_TwoDfold_variables	89
9.29.2.2	destroy_TwoDfold_variables	90
9.29.2.3	TwoDfoldList	90
9.29.2.4	TwoDfold_backtrack_f5	91
9.30	Calculate Partition Functions of a Distance Based Partitioning	92
9.30.1	Detailed Description	92
9.30.2	Function Documentation	92
9.30.2.1	get_TwoDpfold_variables	92
9.30.2.2	get_TwoDpfold_variables_from_MFE	93
9.30.2.3	destroy_TwoDpfold_variables	93
9.30.2.4	TwoDpfoldList	93
9.31	Stochastic Backtracking of Structures from Distance Based Partitioning	95
9.31.1	Detailed Description	95
9.31.2	Function Documentation	95
9.31.2.1	TwoDpfold_pbacktrack	95
9.31.2.2	TwoDpfold_pbacktrack5	96
9.32	Compute the Density of States	97
9.32.1	Detailed Description	97
9.32.2	Variable Documentation	97
9.32.2.1	density_of_states	97
9.33	Parsing and Comparing - Functions to Manipulate Structures	98

## 1.1 Introduction

The core of the Vienna RNA Package ([7], [5]) is formed by a collection of routines for the prediction and comparison of RNA secondary structures. These routines can be accessed through stand-alone programs, such as RNAfold, RNAdistance etc., which should be sufficient for most users. For those who wish to develop their own programs we provide a library which can be linked to your own code.

This document describes the library and will be primarily useful to programmers. However, it also contains details about the implementation that may be of interest to advanced users. The stand-alone programs are described in separate man pages. The latest version of the package including source code and html versions of the documentation can be found at

<http://www.tbi.univie.ac.at/~ivo/RNA/>

## Chapter 2

# Parsing and Comparing - Functions to Manipulate Structures

### Representations of Secondary Structures

The standard representation of a secondary structure is the *bracket notation*, where matching brackets symbolize base pairs and unpaired bases are shown as dots. Alternatively, one may use two types of node labels, 'P' for paired and 'U' for unpaired; a dot is then replaced by '(U)', and each closed bracket is assigned an additional identifier 'P'. We call this the expanded notation. In [3] a condensed representation of the secondary structure is proposed, the so-called homeomorphically irreducible tree (HIT) representation. Here a stack is represented as a single pair of matching brackets labeled 'P' and weighted by the number of base pairs. Correspondingly, a contiguous strain of unpaired bases is shown as one pair of matching brackets labeled 'U' and weighted by its length. Generally any string consisting of matching brackets and identifiers is equivalent to a plane tree with as many different types of nodes as there are identifiers.

Bruce Shapiro proposed a coarse grained representation [11], which, does not retain the full information of the secondary structure. He represents the different structure elements by single matching brackets and labels them as 'H' (hairpin loop), 'I' (interior loop), 'B' (bulge), 'M' (multi-loop), and 'S' (stack). We extend his alphabet by an extra letter for external elements 'E'. Again these identifiers may be followed by a weight corresponding to the number of unpaired bases or base pairs in the structure element. All tree representations (except for the dot-bracket form) can be encapsulated into a virtual root (labeled 'R'), see the example below.

The following example illustrates the different linear tree representations used by the package. All lines show the same secondary structure.

- a) . ((((. . (((. . .))) . . (((. . .))) . .))) .  
(U) ( ( ( ( (U) (U) ( ( (U) (U) (U) P) P) P) (U) (U) ( ( (U) (U) P) P) P) P) (U) P) P) (U)
- b) (U) ( ( (U2) ( (U3) P3) (U2) ( (U2) P2) P2) (U) P2) (U)
- c) ( ( (H) (H) M) B)  
( ( ( ( (H) S) ( (H) S) M) S) B) S)  
( ( ( ( (H) S) ( (H) S) M) S) B) S) E)
- d) ( ( ( ( ( (H3) S3) ( (H2) S2) M4) S2) B1) S2) E2) R)

Above: [Tree](#) representations of secondary structures. a) Full structure: the first line shows the more convenient condensed notation which is used by our programs; the second line shows the rather clumsy expanded notation for completeness, b) HIT structure, c) different versions of coarse grained structures: the second line is exactly Shapiro's representation, the first line is obtained by neglecting the stems. Since each loop is closed by a unique stem, these two lines are equivalent. The third line is an extension taking into account also the external digits. d) weighted coarse structure, this time including the virtual root.

For the output of aligned structures from string editing, different representations are needed, where we put the label on both sides. The above examples for tree representations would then look like:

- a) (UU) (P (P (P (P (UU) (UU) (P (P (P (UU) (UU) (UU) P) P) P) (UU) (UU) (P (P (UU) (U . . .
- b) (UU) (P2 (P2 (U2U2) (P2 (U3U3) P3) (U2U2) (P2 (U2U2) P2) P2) (UU) P2) (UU)
- c) (B (M (HH) (HH) M) B)

```
(S (B (S (M (S (HH) S) (S (HH) S) M) S) B) S)
(E (S (B (S (M (S (HH) S) (S (HH) S) M) S) B) S) E)
d) (R (E2 (S2 (B1 (S2 (M4 (S3 (H3) S3) ((H2) S2) M4) S2) B1) S2) E2) R)
```

Aligned structures additionally contain the gap character '\_'.

## Parsing and Coarse Graining of Structures

Several functions are provided for parsing structures and converting to different representations.

```
char *expand_Full(const char *structure)
```

Convert the full structure from bracket notation to the expanded notation including root.

```
char *b2HIT (const char *structure)
```

Converts the full structure from bracket notation to the HIT notation including root.

```
char *b2C (const char *structure)
```

Converts the full structure from bracket notation to the a coarse grained notation using the 'H' 'B' 'I' 'M' and 'R' identifiers.

```
char *b2Shapiro (const char *structure)
```

Converts the full structure from bracket notation to the *weighted* coarse grained notation using the 'H' 'B' 'I' 'M' 'S' 'E' and 'R' identifiers.

```
char *expand_Shapiro (const char *coarse);
```

Inserts missing 'S' identifiers in unweighted coarse grained structures as obtained from [b2C\(\)](#).

```
char *add_root (const char *structure)
```

Adds a root to an un-rooted tree in any except bracket notation.

```
char *unexpand_Full (const char *ffull)
```

Restores the bracket notation from an expanded full or HIT tree, that is any tree using only identifiers 'U' 'P' and 'R'.

```
char *unweight (const char *wcoarse)
```

Strip weights from any weighted tree.

```
void unexpand_aligned_F (char *align[2])
```

Converts two aligned structures in expanded notation.

```
void parse_structure (const char *structure)
```

Collects a statistic of structure elements of the full structure in bracket notation.

See also

[RNAstruct.h](#) for prototypes and more detailed description

## Distance Measures

A simple measure of dissimilarity between secondary structures of equal length is the base pair distance, given by the number of pairs present in only one of the two structures being compared. I.e. the number of base pairs that have to be opened or closed to transform one structure into the other. It is therefore particularly useful for comparing structures on the same sequence. It is implemented by

```
int bp_distance(const char *str1,
               const char *str2)
```

For other cases a distance measure that allows for gaps is preferable. We can define distances between structures as edit distances between trees or their string representations. In the case of string distances this is the same as "sequence alignment". Given a set of edit operations and edit costs, the edit distance is given by the minimum sum of the costs along an edit path converting one object into the other. Edit distances like these always define a metric. The edit operations used by us are insertion, deletion and replacement of nodes. String editing does not pay attention to the matching of brackets, while in tree editing matching brackets represent a single node of the tree. [Tree](#) editing is therefore usually preferable, although somewhat slower. String edit distances are always smaller or equal to tree edit distances.

The different level of detail in the structure representations defined above naturally leads to different measures of distance. For full structures we use a cost of 1 for deletion or insertion of an unpaired base and 2 for a base pair. Replacing an unpaired base for a pair incurs a cost of 1.

Two cost matrices are provided for coarse grained structures:

```
/* Null,  H,  B,  I,  M,  S,  E  */
{ 0,  2,  2,  2,  2,  1,  1}, /* Null replaced */
{ 2,  0,  2,  2,  2, INF, INF}, /* H   replaced */
{ 2,  2,  0,  1,  2, INF, INF}, /* B   replaced */
{ 2,  2,  1,  0,  2, INF, INF}, /* I   replaced */
{ 2,  2,  2,  2,  0, INF, INF}, /* M   replaced */
{ 1, INF, INF, INF, INF, 0, INF}, /* S   replaced */
{ 1, INF, INF, INF, INF, INF, 0}, /* E   replaced */

/* Null,  H,  B,  I,  M,  S,  E  */
{ 0, 100,  5,  5, 75,  5,  5}, /* Null replaced */
{ 100,  0,  8,  8,  8, INF, INF}, /* H   replaced */
{  5,  8,  0,  3,  8, INF, INF}, /* B   replaced */
{  5,  8,  3,  0,  8, INF, INF}, /* I   replaced */
{ 75,  8,  8,  8,  0, INF, INF}, /* M   replaced */
{  5, INF, INF, INF, INF, 0, INF}, /* S   replaced */
{  5, INF, INF, INF, INF, INF, 0}, /* E   replaced */
```

The lower matrix uses the costs given in [12]. All distance functions use the following global variables:

```
int cost_matrix;
```

Specify the cost matrix to be used for distance calculations.

```
int edit_backtrack;
```

Produce an alignment of the two structures being compared by tracing the editing path giving the minimum distance.

```
char *aligned_line[4];
```

Contains the two aligned structures after a call to one of the distance functions with [edit\\_backtrack](#) set to 1.

See also

[utils.h](#), [dist\\_vars.h](#) and [stringdist.h](#) for more details

### Functions for [Tree](#) Edit Distances

```
Tree    *make_tree (char *struc)
```

Constructs a [Tree](#) ( essentially the postorder list ) of the structure 'struc', for use in [tree\\_edit\\_distance\(\)](#).

```
float    tree_edit_distance (Tree *T1,
                             Tree *T2)
```

Calculates the edit distance of the two trees.

```
void     free_tree(Tree *t)
```

Free the memory allocated for [Tree](#) t.

#### See also

[dist\\_vars.h](#) and [treedist.h](#) for prototypes and more detailed descriptions

### Functions for String Alignment

```
swString *Make_swString (char *string)
```

Convert a structure into a format suitable for [string\\_edit\\_distance\(\)](#).

```
float     string_edit_distance (swString *T1,
                               swString *T2)
```

Calculate the string edit distance of T1 and T2.

#### See also

[dist\\_vars.h](#) and [stringdist.h](#) for prototypes and more detailed descriptions

### Functions for Comparison of Base Pair Probabilities

For comparison of base pair probability matrices, the matrices are first condensed into probability profiles which are then compared by alignment.

```
float *Make_bp_profile_bppm ( double *bppm,
                              int length)
```

condense pair probability matrix into a vector containing probabilities for unpaired, upstream paired and downstream paired.

```
float profile_edit_distance ( const float *T1,
                              const float *T2)
```

Align the 2 probability profiles T1, T2

.

#### See also

ProfileDist.h for prototypes and more details of the above functions

### 3.1 Producing secondary structure graphs

```
int PS_rna_plot ( char *string,
                  char *structure,
                  char *file)
```

Produce a secondary structure graph in PostScript and write it to 'filename'.

```
int PS_rna_plot_a (
    char *string,
    char *structure,
    char *file,
    char *pre,
    char *post)
```

Produce a secondary structure graph in PostScript including additional annotation macros and write it to 'filename'.

```
int gmlRNA (char *string,
            char *structure,
            char *ssfile,
            char option)
```

Produce a secondary structure graph in Graph Meta Language (gml) and write it to a file.

```
int ssv_rna_plot (char *string,
                  char *structure,
                  char *ssfile)
```

Produce a secondary structure graph in SStructView format.

```
int svg_rna_plot (char *string,
                 char *structure,
                 char *ssfile)
```

Produce a secondary structure plot in SVG format and write it to a file.

```
int xrna_plot ( char *string,
                char *structure,
                char *ssfile)
```

Produce a secondary structure plot for further editing in XRNA.

```
int rna_plot_type
```

Switch for changing the secondary structure layout algorithm.

Two low-level functions provide direct access to the graph layouting algorithms:

```
int simple_xy_coordinates ( short *pair_table,
                           float *X,
                           float *Y)
```

Calculate nucleotide coordinates for secondary structure plot the *Simple way*

```
int naview_xy_coordinates ( short *pair_table,
                           float *X,
                           float *Y)
```

See also

[PS\\_dot.h](#) and [naview.h](#) for more detailed descriptions.

## 3.2 Producing (colored) dot plots for base pair probabilities

```
int PS_color_dot_plot ( char *string,
                       cpair *pi,
                       char *filename)
```

```
int PS_color_dot_plot_turn (char *seq,
                           cpair *pi,
                           char *filename,
                           int winSize)
```

```
int PS_dot_plot_list (char *seq,
                    char *filename,
                    plist *pl,
                    plist *mf,
                    char *comment)
```

Produce a postscript dot-plot from two pair lists.

```
int PS_dot_plot_turn (char *seq,
                    struct plist *pl,
                    char *filename,
                    int winSize)
```

See also

[PS\\_dot.h](#) for more detailed descriptions.

### 3.3 Producing (colored) alignments

```
int PS_color_aln (
    const char *structure,
    const char *filename,
    const char *seqs[],
    const char *names[])
```

### 3.4 RNA sequence related utilities

Several functions provide useful applications to RNA sequences

```
char *random_string (int l,
    const char symbols[])
```

Create a random string using characters from a specified symbol set.

```
int hamming ( const char *s1,
    const char *s2)
```

Calculate hamming distance between two sequences.

```
void str_DNA2RNA(char *sequence);
```

Convert a DNA input sequence to RNA alphabet.

```
void str_uppercase(char *sequence);
```

Convert an input sequence to uppercase.

### 3.5 RNA secondary structure related utilities

```
char *pack_structure (const char *struc)
```

Pack secondary structure, 5:1 compression using base 3 encoding.

```
char *unpack_structure (const char *packed)
```

Unpack secondary structure previously packed with [pack\\_structure\(\)](#)

```
short *make_pair_table (const char *structure)
```

Create a pair table of a secondary structure.

```
short *copy_pair_table (const short *pt)
```

Get an exact copy of a pair table.

### 3.6 Miscellaneous Utilities

```
void print_tty_input_seq (void)
```

Print a line to *stdout* that asks for an input sequence.

```
void print_tty_constraint_full (void)
```

Print structure constraint characters to *stdout* (full constraint support)

```
void print_tty_constraint (unsigned int option)
```

Print structure constraint characters to *stdout*. (constraint support is specified by option parameter)

```
int *get_iindx (unsigned int length)
```

Get an index mapper array (iindx) for accessing the energy matrices, e.g. in partition function related functions.

```
int *get_indx (unsigned int length)
```

Get an index mapper array (indx) for accessing the energy matrices, e.g. in MFE related functions.

```
void constrain_ptypes (
    const char *constraint,
    unsigned int length,
    char *ptype,
    int *BP,
    int min_loop_size,
    unsigned int idx_type)
```

Insert constraining pair types according to constraint structure string.

```
char *get_line(FILE *fp);
```

Read a line of arbitrary length from a stream.

```
unsigned int read_record(
    char **header,
    char **sequence,
    char ***rest,
    unsigned int options);
```

Get a data record from *stdin*.

```
char *time_stamp (void)
```

Get a timestamp.

```
void warn_user (const char message[])
```

Print a warning message.

```
void nrerror (const char message[])
```

Die with an error message.

```
void init_rand (void)
```

Make random number seeds.

```
unsigned short xsubi[3];
```

Current 48 bit random number.

```
double urn (void)
```

get a random number from [0..1]

```
int    int_urn (int from, int to)
```

Generates a pseudo random integer in a specified range.

```
void  *space (unsigned size)
```

Allocate space safely.

```
void  *xrealloc ( void *p,  
                  unsigned size)
```

Reallocate space safely.

See also

[utils.h](#) for a complete overview and detailed description of the utility functions

[Next Page: Examples](#)

## Chapter 4

# Example - A Small Example Program

The following program exercises most commonly used functions of the library. The program folds two sequences using both the mfe and partition function algorithms and calculates the tree edit and profile distance of the resulting structures and base pairing probabilities.

```
#include <stdio.h>
#include <stdlib.h>
#include <math.h>
#include <string.h>
#include "utils.h"
#include "fold_vars.h"
#include "fold.h"
#include "part_func.h"
#include "inverse.h"
#include "RNAstruct.h"
#include "treedist.h"
#include "stringdist.h"
#include "profiledist.h"

void main()
{
    char *seq1="CGCAGGGAUACCCGCG", *seq2="GCGCCCAUAGGGACGC",
        *struct1,* struct2,* xstruc;
    float e1, e2, tree_dist, string_dist, profile_dist, kT;
    Tree *T1, *T2;
    swString *S1, *S2;
    float *pfl, *pf2;
    FLT_OR_DBL *bppm;
    /* fold at 30C instead of the default 37C */
    temperature = 30.;          /* must be set *before* initializing */

    /* allocate memory for structure and fold */
    struct1 = (char* ) space(sizeof(char)*(strlen(seq1)+1));
    e1 = fold(seq1, struct1);

    struct2 = (char* ) space(sizeof(char)*(strlen(seq2)+1));
    e2 = fold(seq2, struct2);

    free_arrays();              /* free arrays used in fold() */

    /* produce tree and string representations for comparison */
    xstruc = expand_Full(struct1);
    T1 = make_tree(xstruc);
    S1 = Make_swString(xstruc);
    free(xstruc);

    xstruc = expand_Full(struct2);
    T2 = make_tree(xstruc);
    S2 = Make_swString(xstruc);
    free(xstruc);

    /* calculate tree edit distance and aligned structures with gaps */
    edit_backtrack = 1;
    tree_dist = tree_edit_distance(T1, T2);
    free_tree(T1); free_tree(T2);
    unexpand_aligned_F(aligned_line);
    printf("%s\n%s  %3.2f\n", aligned_line[0], aligned_line[1], tree_dist);

    /* same thing using string edit (alignment) distance */
    string_dist = string_edit_distance(S1, S2);
    free(S1); free(S2);
    printf("%s mfe=%5.2f\n%s mfe=%5.2f dist=%3.2f\n",
        aligned_line[0], e1, aligned_line[1], e2, string_dist);
```

```

/* for longer sequences one should also set a scaling factor for
   partition function folding, e.g: */
kT = (temperature+273.15)*1.98717/1000.; /* kT in kcal/mol */
pf_scale = exp(-e1/kT/strlen(seq1));

/* calculate partition function and base pair probabilities */
e1 = pf_fold(seq1, struct1);
/* get the base pair probability matrix for the previous run of pf_fold() */
bppm = export_bppm();
pf1 = Make_bp_profile_bppm(bppm, strlen(seq1));

e2 = pf_fold(seq2, struct2);
/* get the base pair probability matrix for the previous run of pf_fold() */
bppm = export_bppm();
pf2 = Make_bp_profile_bppm(bppm, strlen(seq2));

free_pf_arrays(); /* free space allocated for pf_fold() */

profile_dist = profile_edit_distance(pf1, pf2);
printf("%s free energy=%5.2f\n%s free energy=%5.2f dist=%3.2f\n",
        aligned_line[0], e1, aligned_line[1], e2, profile_dist);

free_profile(pf1); free_profile(pf2);
}

```

In a typical Unix environment you would compile this program using:

```
cc ${OPENMP_CFLAGS} -c example.c -I${hpath}
```

and link using

```
cc ${OPENMP_CFLAGS} -o example -L${lpath} -lRNA -lm
```

where *hpath* and *lpath* point to the location of the header files and library, respectively.

#### Note

As default, the RNAlib is compiled with build-in *OpenMP* multithreading support. Thus, when linking your own object files to the library you have to pass the compiler specific *OPENMP\_CFLAGS* (e.g. '-fopenmp' for **gcc**) even if your code does not use openmp specific code. However, in that case the *OpenMP* flags may be omitted when compiling example.c

## Chapter 5

# Deprecated List

**globalScope> Global [base\\_pair](#)**

Do not use this variable anymore!

**globalScope> Global [centroid](#) (int length, double \*dist)**

This function is deprecated and should not be used anymore as it is not threadsafe!

See also

[get\\_centroid\\_struct\\_pl\(\)](#), [get\\_centroid\\_struct\\_pr\(\)](#)

**globalScope> Global [energy\\_of\\_circ\\_struct](#) (const char \*string, const char \*structure)**

This function is deprecated and should not be used in future programs! Use [energy\\_of\\_circ\\_structure\(\)](#) instead!

**globalScope> Global [energy\\_of\\_struct](#) (const char \*string, const char \*structure)**

This function is deprecated and should not be used in future programs! Use [energy\\_of\\_structure\(\)](#) instead!

**globalScope> Global [energy\\_of\\_struct\\_pt](#) (const char \*string, short \*ptable, short \*s, short \*s1)**

This function is deprecated and should not be used in future programs! Use [energy\\_of\\_structure\\_pt\(\)](#) instead!

**globalScope> Global [expHairpinEnergy](#) (int u, int type, short si1, short sj1, const char \*string)**

Use [exp\\_E\\_Hairpin\(\)](#) from [loop\\_energies.h](#) instead

**globalScope> Global [expLoopEnergy](#) (int u1, int u2, int type, int type2, short si1, short sj1, short sp1, short sq1)**

Use [exp\\_E\\_IntLoop\(\)](#) from [loop\\_energies.h](#) instead

**globalScope> Global [get\\_plist](#) (struct plist \*pl, int length, double cut\_off)**

{ This function is deprecated and will be removed soon!} use [assign\\_plist\\_from\\_pr\(\)](#) instead!

**globalScope> Global [HairpinE](#) (int size, int type, int si1, int sj1, const char \*string)**

{This function is deprecated and will be removed soon. Use [E\\_Hairpin\(\)](#) instead!}

**globalScope> Global [iindx](#)**

Do not use this variable anymore!

**globalScope> Global [init\\_co\\_pf\\_fold](#) (int length)**

{ This function is deprecated and will be removed soon!}

**globalScope> Global [init\\_pf\\_fold](#) (int length)**

This function is obsolete and will be removed soon!

**globalScope> Global [initialize\\_cofold](#) (int length)**

{This function is obsolete and will be removed soon!}

**globalScope> Global [initialize\\_fold](#) (int length)**

{This function is deprecated and will be removed soon!}

**globalScope> Global [LoopEnergy](#) (int n1, int n2, int type, int type\_2, int si1, int sj1, int sp1, int sq1)**

{This function is deprecated and will be removed soon. Use [E\\_IntLoop\(\)](#) instead!}

**globalScope> Global [Make\\_bp\\_profile](#) (int length)**

This function is deprecated and will be removed soon! See [Make\\_bp\\_profile\\_bppm\(\)](#) for a replacement

**globalScope> Global [mean\\_bp\\_dist](#) (int length)**

This function is not threadsafe and should not be used anymore. Use [mean\\_bp\\_distance\(\)](#) instead!

**globalScope> Global [pr](#)**

Do not use this variable anymore!

**globalScope> Global [PS\\_dot\\_plot](#) (char \*string, char \*file)**

This function is deprecated and will be removed soon! Use [PS\\_dot\\_plot\\_list\(\)](#) instead!

## Chapter 6

# Module Index

### 6.1 Modules

Here is a list of all modules:

RNA Secondary Structure Folding . . . . .	25
Calculating Minimum Free Energy (MFE) Structures . . . . .	28
MFE Structures of two hybridized Sequences . . . . .	48
MFE Consensus Structures for Sequence Alignment(s) . . . . .	60
Local MFE structure Prediction and Z-scores . . . . .	66
Calculating MFE representatives of a Distance Based Partitioning . . . . .	89
Calculating Partition Functions and Pair Probabilities . . . . .	31
Compute the structure with maximum expected accuracy (MEA) . . . . .	38
Compute the centroid structure . . . . .	39
Partition Function for two hybridized Sequences . . . . .	50
Partition Function for two hybridized Sequences as a stepwise Process . . . . .	54
Partition Function and Base Pair Probabilities for Sequence Alignment(s) . . . . .	62
Partition functions for locally stable secondary structures . . . . .	67
Calculate Partition Functions of a Distance Based Partitioning . . . . .	92
Enumerating Suboptimal Structures . . . . .	41
Suboptimal structures according to Zuker et al. 1989 . . . . .	42
Suboptimal structures within an energy band around the MFE . . . . .	43
Stochastic backtracking in the Ensemble . . . . .	45
Stochastic Backtracking of Consensus Structures from Sequence Alignment(s) . . . . .	64
Stochastic Backtracking of Structures from Distance Based Partitioning . . . . .	95
Calculate Secondary Structures of two RNAs upon Dimerization . . . . .	47
MFE Structures of two hybridized Sequences . . . . .	48
Partition Function for two hybridized Sequences . . . . .	50
Partition Function for two hybridized Sequences as a stepwise Process . . . . .	54
Predicting Consensus Structures from Alignment(s) . . . . .	56
MFE Consensus Structures for Sequence Alignment(s) . . . . .	60
Partition Function and Base Pair Probabilities for Sequence Alignment(s) . . . . .	62
Stochastic Backtracking of Consensus Structures from Sequence Alignment(s) . . . . .	64
Local MFE consensus structures for Sequence Alignments . . . . .	70
Predicting Locally stable structures of large sequences . . . . .	65
Local MFE structure Prediction and Z-scores . . . . .	66
Partition functions for locally stable secondary structures . . . . .	67
Local MFE consensus structures for Sequence Alignments . . . . .	70
Change and Precalculate Energy Parameter Sets and Boltzmann Factors . . . . .	71
Reading/Writing energy parameter sets from/to File . . . . .	74
Converting energy parameter files . . . . .	77
Energy evaluation . . . . .	81

Searching Sequences for Predefined Structures . . . . .	85
Classified Dynamic Programming . . . . .	87
Distance based partitioning of the Secondary Structure Space . . . . .	88
Calculating MFE representatives of a Distance Based Partitioning . . . . .	89
Calculate Partition Functions of a Distance Based Partitioning . . . . .	92
Stochastic Backtracking of Structures from Distance Based Partitioning . . . . .	95
Compute the Density of States . . . . .	97
Parsing and Comparing - Functions to Manipulate Structures . . . . .	98

## Chapter 7

# Data Structure Index

### 7.1 Data Structures

Here are the data structures with brief descriptions:

<a href="#">bondT</a>	Base pair . . . . .	99
<a href="#">bondTEn</a>	Base pair with associated energy . . . . .	99
<a href="#">cofoldF</a>	. . . . .	99
<a href="#">ConcEnt</a>	. . . . .	100
<a href="#">constrain</a>	Constraints for cofolding . . . . .	100
<a href="#">COORDINATE</a>	This is a workaround for the SWIG Perl Wrapper RNA plot function that returns an array of type <a href="#">COORDINATE</a> . . . . .	100
<a href="#">cpair</a>	This datastructure is used as input parameter in functions of PS_dot.c . . . . .	100
<a href="#">duplexT</a>	. . . . .	101
<a href="#">dupVar</a>	. . . . .	101
<a href="#">folden</a>	. . . . .	101
<a href="#">interact</a>	. . . . .	101
<a href="#">intermediate_t</a>	. . . . .	102
<a href="#">INTERVAL</a>	Sequence interval stack element used in subopt.c . . . . .	102
<a href="#">LIST</a>	. . . . .	103
<a href="#">LST_BUCKET</a>	. . . . .	103
<a href="#">model_detailsT</a>	The data structure that contains the complete model details used throughout the calculations . . . . .	103
<a href="#">move_t</a>	. . . . .	104
<a href="#">PAIR</a>	Base pair data structure used in subopt.c . . . . .	104
<a href="#">pair_info</a>	A base pair info structure . . . . .	105
<a href="#">pairpro</a>	. . . . .	106
<a href="#">paramT</a>	The datastructure that contains temperature scaled energy parameters . . . . .	106
<a href="#">path_t</a>	. . . . .	107
<a href="#">pf_paramT</a>	The datastructure that contains temperature scaled Boltzmann weights of the energy parameters . . . . .	107
<a href="#">plist</a>	This datastructure is used as input parameter in functions of <a href="#">PS_dot.h</a> and others . . . . .	108
<a href="#">Postorder_list</a>	. . . . .	108

<a href="#">pu_contrib</a>	
Contributions to p_u	108
<a href="#">pu_out</a>	
Collection of all free_energy of beeing unpaired values for output	109
<a href="#">sect</a>	
Stack of partial structures for backtracking	109
<a href="#">snoopT</a>	109
<a href="#">SOLUTION</a>	
Solution element from subopt.c	110
<a href="#">struct_en</a>	110
<a href="#">svm_model</a>	110
<a href="#">swString</a>	110
<a href="#">Tree</a>	111
<a href="#">TwoDfold_solution</a>	
Solution element returned from TwoDfoldList	111
<a href="#">TwoDfold_vars</a>	
Variables compound for 2Dfold MFE folding	112
<a href="#">TwoDpfold_solution</a>	
Solution element returned from TwoDpfoldList	113
<a href="#">TwoDpfold_vars</a>	
Variables compound for 2Dfold partition function folding	113

## Chapter 8

# File Index

### 8.1 File List

Here is a list of all documented files with brief descriptions:

<b>mainpage.h</b>	??
/home/mescal/ronny/WORK/ViennaRNA/H/2Dfold.h	117
/home/mescal/ronny/WORK/ViennaRNA/H/2Dpfold.h	118
/home/mescal/ronny/WORK/ViennaRNA/H/ali_plex.h	??
/home/mescal/ronny/WORK/ViennaRNA/H/alifold.h	
Compute various properties (consensus MFE structures, partition function, Boltzmann distributed stochastic samples, ...) for RNA sequence alignments	118
/home/mescal/ronny/WORK/ViennaRNA/H/aln_util.h	??
/home/mescal/ronny/WORK/ViennaRNA/H/cofold.h	
MFE version of cofolding routines	120
/home/mescal/ronny/WORK/ViennaRNA/H/convert_epars.h	
Functions and definitions for energy parameter file format conversion	122
/home/mescal/ronny/WORK/ViennaRNA/H/data_structures.h	
All datastructures and typedefs shared among the Vienna RNA Package can be found here	123
/home/mescal/ronny/WORK/ViennaRNA/H/dist_vars.h	
Global variables for Distance-Package	125
/home/mescal/ronny/WORK/ViennaRNA/H/duplex.h	
Duplex folding function declarations..	126
/home/mescal/ronny/WORK/ViennaRNA/H/edit_cost.h	
Global variables for Edit Costs included by treedist.c and stringdist.c	126
/home/mescal/ronny/WORK/ViennaRNA/H/energy_const.h	127
/home/mescal/ronny/WORK/ViennaRNA/H/energy_par.h	??
/home/mescal/ronny/WORK/ViennaRNA/H/energy_par_D.h	??
/home/mescal/ronny/WORK/ViennaRNA/H/energy_par_RD.h	??
/home/mescal/ronny/WORK/ViennaRNA/H/findpath.h	
Compute direct refolding paths between two secondary structures	128
/home/mescal/ronny/WORK/ViennaRNA/H/fold.h	
MFE calculations and energy evaluations for single RNA sequences	130
/home/mescal/ronny/WORK/ViennaRNA/H/fold_vars.h	
Here all all declarations of the global variables used throughout RNAlib	136
/home/mescal/ronny/WORK/ViennaRNA/H/gquad.h	
Various functions related to G-quadruplex computations	141
/home/mescal/ronny/WORK/ViennaRNA/H/inverse.h	
Inverse folding routines	143
/home/mescal/ronny/WORK/ViennaRNA/H/Lfold.h	
Predicting local MFE structures of large sequences	143
/home/mescal/ronny/WORK/ViennaRNA/H/loop_energies.h	
Energy evaluation for MFE and partition function calculations	144

/home/mescalini/ronny/WORK/ViennaRNA/H/LPfold.h	
Function declarations of partition function variants of the Lfold algorithm	149
/home/mescalini/ronny/WORK/ViennaRNA/H/MEA.h	
Computes a MEA (maximum expected accuracy) structure	150
/home/mescalini/ronny/WORK/ViennaRNA/H/mm.h	
Several Maximum Matching implementations	151
/home/mescalini/ronny/WORK/ViennaRNA/H/move_set.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/naview.h	151
/home/mescalini/ronny/WORK/ViennaRNA/H/pair_mat.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/params.h	152
/home/mescalini/ronny/WORK/ViennaRNA/H/part_func.h	
Partition function of single RNA sequences	153
/home/mescalini/ronny/WORK/ViennaRNA/H/part_func_co.h	
Partition function for two RNA sequences	155
/home/mescalini/ronny/WORK/ViennaRNA/H/part_func_up.h	
Partition Function Cofolding as stepwise process	157
/home/mescalini/ronny/WORK/ViennaRNA/H/PKplex.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/plex.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/plot_layouts.h	
Secondary structure plot layout algorithms	158
/home/mescalini/ronny/WORK/ViennaRNA/H/ProfileAIn.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/profiledist.h	162
/home/mescalini/ronny/WORK/ViennaRNA/H/PS_dot.h	
Various functions for plotting RNA secondary structures, dot-plots and other visualizations	163
/home/mescalini/ronny/WORK/ViennaRNA/H/read_epars.h	167
/home/mescalini/ronny/WORK/ViennaRNA/H/ribo.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/RNAstruct.h	
Parsing and Coarse Graining of Structures	167
/home/mescalini/ronny/WORK/ViennaRNA/H/snofold.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/snoop.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/stringdist.h	
Functions for String Alignment	171
/home/mescalini/ronny/WORK/ViennaRNA/H/subopt.h	
RNAsubopt and density of states declarations	173
/home/mescalini/ronny/WORK/ViennaRNA/H/svm_utils.h	??
/home/mescalini/ronny/WORK/ViennaRNA/H/treedist.h	
Functions for Tree Edit Distances	174
/home/mescalini/ronny/WORK/ViennaRNA/H/utils.h	
Various utility- and helper-functions used throughout the Vienna RNA package	175
/home/mescalini/ronny/WORK/ViennaRNA/lib/1.8.4_epars.h	
Free energy parameters for parameter file conversion	190
/home/mescalini/ronny/WORK/ViennaRNA/lib/1.8.4_intloops.h	
Free energy parameters for interior loop contributions needed by the parameter file conversion functions	191
/home/mescalini/ronny/WORK/ViennaRNA/lib/intl11.h	??
/home/mescalini/ronny/WORK/ViennaRNA/lib/intl11_D.h	??
/home/mescalini/ronny/WORK/ViennaRNA/lib/intl11_RD.h	??
/home/mescalini/ronny/WORK/ViennaRNA/lib/intl11dH.h	??
/home/mescalini/ronny/WORK/ViennaRNA/lib/intl11dH_D.h	??
/home/mescalini/ronny/WORK/ViennaRNA/lib/intl11dH_RD.h	??

#### 9.2.1 Detailed Description

This module contains all functions and variables related to the calculation of global minimum free energy structures for single sequences.

This section covers all functions and variables related to the calculation of minimum free energy (MFE) structures.

The library provides a fast dynamic programming minimum free energy folding algorithm as described by Zuker & Stiegler (1981).

The library provides a fast dynamic programming minimum free energy folding algorithm as described in [14]. All relevant parts that directly implement the "Zuker & Stiegler" algorithm for single sequences are described in this section.

Folding of circular RNA sequences is handled as a post-processing step of the forward recursions. See [6] for further details.

Nevertheless, the RNAlib also provides interfaces for the prediction of consensus MFE structures of sequence alignments, MFE structure for two hybridized sequences, local optimal structures and many more. For those more specialized variants of MFE folding routines, please consult the appropriate subsections (Modules) as listed above.

## 9.2.2 Function Documentation

### 9.2.2.1 float fold\_par ( const char \* *sequence*, char \* *structure*, paramT \* *parameters*, int *is\_constrained*, int *is\_circular* )

Compute minimum free energy and an appropriate secondary structure of an RNA sequence.

The first parameter given, the RNA sequence, must be *uppercase* and should only contain an alphabet  $\Sigma$  that is understood by the RNAlib

(e.g.  $\Sigma = \{A, U, C, G\}$ )

The second parameter, *structure*, must always point to an allocated block of memory with a size of at least `strlen(sequence) + 1`

If the third parameter is NULL, global model detail settings are assumed for the folding recursions. Otherwise, the provided parameters are used.

The fourth parameter indicates whether a secondary structure constraint in enhanced dot-bracket notation is passed through the structure parameter or not. If so, the characters "`| x < >`" are recognized to mark bases that are paired, unpaired, paired upstream, or downstream, respectively. Matching brackets "`( )`" denote base pairs, dots "." are used for unconstrained bases.

To indicate that the RNA sequence is circular and thus has to be post-processed, set the last parameter to non-zero

After a successful call of `fold_par()`, a backtracked secondary structure (in dot-bracket notation) that exhibits the minimum of free energy will be written to the memory *structure* is pointing to. The function returns the minimum of free energy for any fold of the sequence given.

#### Note

OpenMP: Passing NULL to the 'parameters' argument involves access to several global model detail variables and thus is not to be considered threadsafe

#### See also

[fold\(\)](#), [circfold\(\)](#), [model\\_detailsT](#), [set\\_energy\\_model\(\)](#), [get\\_scaled\\_parameters\(\)](#)

#### Parameters

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to
<i>parameters</i>	A data structure containing the prescaled energy contributions and the model details. (NULL may be passed, see OpenMP notes above)
<i>is_constrained</i>	Switch to indicate that a structure constraint is passed via the structure argument (0==off)
<i>is_circular</i>	Switch to (de-)activate postprocessing steps in case RNA sequence is circular (0==off)

#### Returns

the minimum free energy (MFE) in kcal/mol

### 9.2.2.2 float fold ( const char \* *sequence*, char \* *structure* )

Compute minimum free energy and an appropriate secondary structure of an RNA sequence.

This function essentially does the same thing as [fold\\_par\(\)](#). However, it takes its model details, i.e. [temperature](#), [dangles](#), [tetra\\_loop](#), [noGU](#), [no\\_closingGU](#), [fold\\_constrained](#), [noLonelyPairs](#) from the current global settings within the library

Use [fold\\_par\(\)](#) for a completely threadsafe variant

See also

[fold\\_par\(\)](#), [circfold\(\)](#)

#### Parameters

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

#### Returns

the minimum free energy (MFE) in kcal/mol

### 9.2.2.3 float circfold ( const char \* *sequence*, char \* *structure* )

Compute minimum free energy and an appropriate secondary structure of a circular RNA sequence.

This function essentially does the same thing as [fold\\_par\(\)](#). However, it takes its model details, i.e. [temperature](#), [dangles](#), [tetra\\_loop](#), [noGU](#), [no\\_closingGU](#), [fold\\_constrained](#), [noLonelyPairs](#) from the current global settings within the library

Use [fold\\_par\(\)](#) for a completely threadsafe variant

See also

[fold\\_par\(\)](#), [circfold\(\)](#)

#### Parameters

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

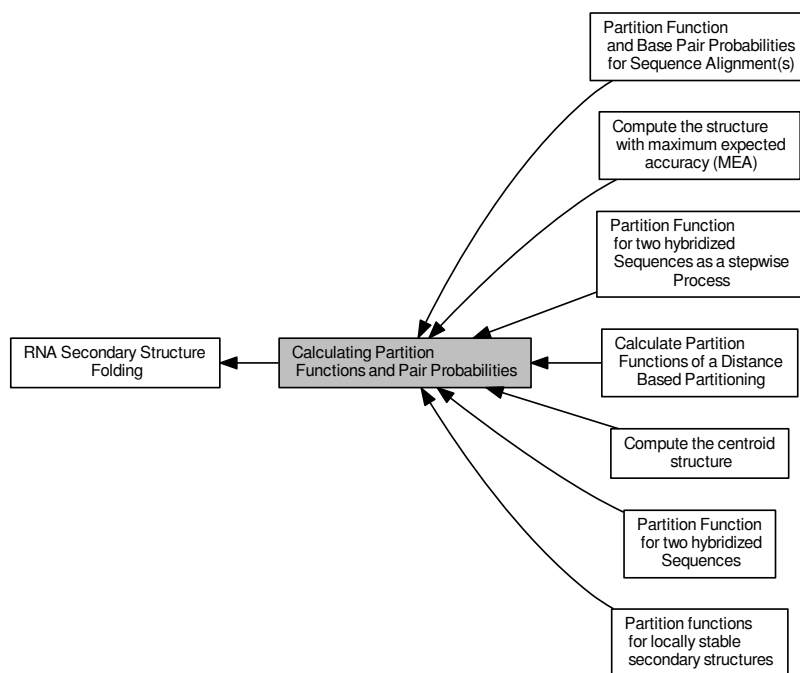

#### Returns

the minimum free energy (MFE) in kcal/mol

## 9.3 Calculating Partition Functions and Pair Probabilities

This section provides information about all functions and variables related to the calculation of the partition function and base pair probabilities.

### 9.3.1 Detailed Description

This section provides information about all functions and variables related to the calculation of the partition function and base pair probabilities.

Instead of the minimum free energy structure the partition function of all possible structures and from that the pairing probability for every possible pair can be calculated, using a dynamic programming algorithm as described in [10].

### 9.3.2 Function Documentation

#### 9.3.2.1 float `pf_fold_par` ( const char \* *sequence*, char \* *structure*, `pf_paramT` \* *parameters*, int *calculate\_bppm*, int *is\_constrained*, int *is\_circular* )

Compute the partition function  $Q$  for a given RNA sequence.

If *structure* is not a NULL pointer on input, it contains on return a string consisting of the letters " . , | { } ( ) " denoting bases that are essentially unpaired, weakly paired, strongly paired without preference, weakly upstream (downstream) paired, or strongly up- (down-)stream paired bases, respectively. If `fold_constrained` is not 0, the *structure* string is interpreted on input as a list of constraints for the folding. The character "x" marks bases that must be unpaired, matching brackets " ( ) " denote base pairs, all other characters are ignored. Any pairs conflicting with the constraint will be forbidden. This is usually sufficient to ensure the constraints are honored. If the parameter `calculate_bppm` is set to 0 base pairing probabilities will not be computed (saving CPU time), otherwise after calculations took place `pr` will contain the probability that bases  $i$  and  $j$  pair.

**Note**

The global array `pr` is deprecated and the user who wants the calculated base pair probabilities for further computations is advised to use the function `export_bppm()`

**Postcondition**

After successful run the hidden folding matrices are filled with the appropriate Boltzmann factors. Depending on whether the global variable `do_backtrack` was set the base pair probabilities are already computed and may be accessed for further usage via the `export_bppm()` function. A call of `free_pf_arrays()` will free all memory allocated by this function. Successive calls will first free previously allocated memory before starting the computation.

**See also**

`pf_fold()`, `pf_circ_fold()`, `bppm_to_structure()`, `export_bppm()`, `get_boltzmann_factors()`, `free_pf_arrays()`

**Parameters**

<code>in</code>	<code>sequence</code>	The RNA sequence input
<code>in, out</code>	<code>structure</code>	A pointer to a char array where a base pair probability information can be stored in a pseudo-dot-bracket notation (may be NULL, too)
<code>in</code>	<code>parameters</code>	Data structure containing the precalculated Boltzmann factors
<code>in</code>	<code>calculate_bppm</code>	Switch to Base pair probability calculations on/off (0==off)
<code>in</code>	<code>is_constrained</code>	Switch to indicate that a structure constraint is passed via the structure argument (0==off)
<code>in</code>	<code>is_circular</code>	Switch to (de-)activate postprocessing steps in case RNA sequence is circular (0==off)

**Returns**

The Gibbs free energy of the ensemble ( $G = -RT \cdot \log(Q)$ ) in kcal/mol

**9.3.2.2 float pf\_fold ( const char \* sequence, char \* structure )**

Compute the partition function  $Q$  of an RNA sequence.

If `structure` is not a NULL pointer on input, it contains on return a string consisting of the letters ". , | { } ( ) " denoting bases that are essentially unpaired, weakly paired, strongly paired without preference, weakly upstream (downstream) paired, or strongly up- (down-)stream paired bases, respectively. If `fold_constrained` is not 0, the `structure` string is interpreted on input as a list of constraints for the folding. The character "x" marks bases that must be unpaired, matching brackets " ( ) " denote base pairs, all other characters are ignored. Any pairs conflicting with the constraint will be forbidden. This is usually sufficient to ensure the constraints are honored. If `do_backtrack` has been set to 0 base pairing probabilities will not be computed (saving CPU time), otherwise `pr` will contain the probability that bases  $i$  and  $j$  pair.

**Note**

The global array `pr` is deprecated and the user who wants the calculated base pair probabilities for further computations is advised to use the function `export_bppm()`.

**OpenMP:** This function is not entirely threadsafe. While the recursions are working on their own copies of data the model details for the recursions are determined from the global settings just before entering the recursions. Consider using `pf_fold_par()` for a really threadsafe implementation.

**Precondition**

This function takes its model details from the global variables provided in `RNAlib`

**Postcondition**

After successful run the hidden folding matrices are filled with the appropriate Boltzmann factors. Depending on whether the global variable `do_backtrack` was set the base pair probabilities are already computed and may be accessed for further usage via the `export_bppm()` function. A call of `free_pf_arrays()` will free all memory allocated by this function. Successive calls will first free previously allocated memory before starting the computation.

**See also**

[pf\\_fold\\_par\(\)](#), [pf\\_circ\\_fold\(\)](#), [bppm\\_to\\_structure\(\)](#), [export\\_bppm\(\)](#)

**Parameters**

<i>sequence</i>	The RNA sequence input
<i>structure</i>	A pointer to a char array where a base pair probability information can be stored in a pseudo-dot-bracket notation (may be NULL, too)

**Returns**

The Gibbs free energy of the ensemble (  $G = -RT \cdot \log(Q)$  ) in kcal/mol

**9.3.2.3 float pf\_circ\_fold ( const char \* *sequence*, char \* *structure* )**

Compute the partition function of a circular RNA sequence.

**Note**

The global array `pr` is deprecated and the user who wants the calculated base pair probabilities for further computations is advised to use the function `export_bppm()`.

**OpenMP:** This function is not entirely threadsafe. While the recursions are working on their own copies of data the model details for the recursions are determined from the global settings just before entering the recursions. Consider using `pf_fold_par()` for a really threadsafe implementation.

**Precondition**

This function takes its model details from the global variables provided in *RNAlib*

**Postcondition**

After successful run the hidden folding matrices are filled with the appropriate Boltzmann factors. Depending on whether the global variable `do_backtrack` was set the base pair probabilities are already computed and may be accessed for further usage via the `export_bppm()` function. A call of `free_pf_arrays()` will free all memory allocated by this function. Successive calls will first free previously allocated memory before starting the computation.

**See also**

[pf\\_fold\\_par\(\)](#), [pf\\_fold\(\)](#)

**Parameters**

<code>in</code>	<i>sequence</i>	The RNA sequence input
<code>in,out</code>	<i>structure</i>	A pointer to a char array where a base pair probability information can be stored in a pseudo-dot-bracket notation (may be NULL, too)

**Returns**

The Gibbs free energy of the ensemble ( $G = -RT \cdot \log(Q)$ ) in kcal/mol

**9.3.2.4 void free\_pf\_arrays ( void )**

Free arrays for the partition function recursions.

Call this function if you want to free all allocated memory associated with the partition function forward recursion.

**Note**

Successive calls of [pf\\_fold\(\)](#), [pf\\_circ\\_fold\(\)](#) already check if they should free any memory from a previous run.

**OpenMP notice:**

This function should be called before leaving a thread in order to avoid leaking memory

**Postcondition**

All memory allocated by [pf\\_fold\\_par\(\)](#), [pf\\_fold\(\)](#) or [pf\\_circ\\_fold\(\)](#) will be free'd

**See also**

[pf\\_fold\\_par\(\)](#), [pf\\_fold\(\)](#), [pf\\_circ\\_fold\(\)](#)

**9.3.2.5 void update\_pf\_params ( int length )**

Recalculate energy parameters.

Call this function to recalculate the pair matrix and energy parameters after a change in folding parameters like [temperature](#)

**9.3.2.6 double\* export\_bppm ( void )**

Get a pointer to the base pair probability array

Accessing the base pair probabilities for a pair (i,j) is achieved by.

```
00001 FLT_OR_DBL *pr = export_bppm();
00002 pr_ij           = pr[iindx[i]-j];
```

**Precondition**

Call [pf\\_fold\\_par\(\)](#), [pf\\_fold\(\)](#) or [pf\\_circ\\_fold\(\)](#) first to fill the base pair probability array

**See also**

[pf\\_fold\(\)](#), [pf\\_circ\\_fold\(\)](#), [get\\_iindx\(\)](#)

**Returns**

A pointer to the base pair probability array

### 9.3.2.7 void assign\_plist\_from\_pr ( plist \*\* *pl*, double \* *probs*, int *length*, double *cutoff* )

Create a plist from a probability matrix.

The probability matrix given is parsed and all pair probabilities above the given threshold are used to create an entry in the plist

The end of the plist is marked by sequence positions *i* as well as *j* equal to 0. This condition should be used to stop looping over its entries

#### Note

This function is threadsafe

#### Parameters

out	<i>pl</i>	A pointer to the plist that is to be created
in	<i>probs</i>	The probability matrix used for creting the plist
in	<i>length</i>	The length of the RNA sequence
in	<i>cutoff</i>	The cutoff value

### 9.3.2.8 int get\_pf\_arrays ( short \*\* *S\_p*, short \*\* *S1\_p*, char \*\* *ptype\_p*, double \*\* *qb\_p*, double \*\* *qm\_p*, double \*\* *q1k\_p*, double \*\* *qln\_p* )

Get the pointers to (almost) all relavant computation arrays used in partition function computation.

#### Precondition

In order to assign meaningful pointers, you have to call [pf\\_fold\\_par\(\)](#) or [pf\\_fold\(\)](#) first!

#### See also

[pf\\_fold\\_par\(\)](#), [pf\\_fold\(\)](#), [pf\\_circ\\_fold\(\)](#)

#### Parameters

out	<i>S_p</i>	A pointer to the 'S' array (integer representation of nucleotides)
out	<i>S1_p</i>	A pointer to the 'S1' array (2nd integer representation of nucleotides)
out	<i>ptype_p</i>	A pointer to the pair type matrix
out	<i>qb_p</i>	A pointer to the $Q^B$ matrix
out	<i>qm_p</i>	A pointer to the $Q^M$ matrix
out	<i>q1k_p</i>	A pointer to the 5' slice of the Q matrix ( $q1k(k) = Q(1, k)$ )
out	<i>qln_p</i>	A pointer to the 3' slice of the Q matrix ( $qln(l) = Q(l, n)$ )

#### Returns

Non Zero if everything went fine, 0 otherwise

### 9.3.2.9 double mean\_bp\_distance ( int *length* )

Get the mean base pair distance of the last partition function computation.

#### Note

To ensure thread-safety, use the function [mean\\_bp\\_distance\\_pr\(\)](#) instead!

#### See also

[mean\\_bp\\_distance\\_pr\(\)](#)

## Parameters

<i>length</i>	
---------------	--

## Returns

mean base pair distance in thermodynamic ensemble

9.3.2.10 double mean\_bp\_distance\_pr ( int *length*, double \* *pr* )

Get the mean base pair distance in the thermodynamic ensemble.

This is a threadsafe implementation of [mean\\_bp\\_dist\(\)](#) !

$$\langle d \rangle = \sum_{a,b} p_a p_b d(S_a, S_b)$$

this can be computed from the pair probs  $p_{ij}$  as

$$\langle d \rangle = \sum_{ij} p_{ij} (1 - p_{ij})$$

## Note

This function is threadsafe

## Parameters

<i>length</i>	The length of the sequence
<i>pr</i>	The matrix containing the base pair probabilities

## Returns

The mean pair distance of the structure ensemble

## 9.4 Compute the structure with maximum expected accuracy (MEA)

Collaboration diagram for Compute the structure with maximum expected accuracy (MEA):

## 9.5 Compute the centroid structure

Collaboration diagram for Compute the centroid structure:

### Functions

- `char * get_centroid_struct_pl (int length, double *dist, plist *pl)`  
Get the centroid structure of the ensemble.
- `char * get_centroid_struct_pr (int length, double *dist, double *pr)`  
Get the centroid structure of the ensemble.

#### 9.5.1 Detailed Description

#### 9.5.2 Function Documentation

##### 9.5.2.1 `char* get_centroid_struct_pl ( int length, double * dist, plist * pl )`

Get the centroid structure of the ensemble.

This function is a threadsafe replacement for `centroid()` with a 'plist' input

The centroid is the structure with the minimal average distance to all other structures

$$\langle d(S) \rangle = \sum_{(i,j) \in S} (1 - p_{ij}) + \sum_{(i,j) \notin S} p_{ij}$$

Thus, the centroid is simply the structure containing all pairs with  $p_{ij} > 0.5$ . The distance of the centroid to the ensemble is written to the memory addressed by `dist`.

##### Parameters

in	<i>length</i>	The length of the sequence
out	<i>dist</i>	A pointer to the distance variable where the centroid distance will be written to
in	<i>pl</i>	A pair list containing base pair probability information about the ensemble

##### Returns

The centroid structure of the ensemble in dot-bracket notation

##### 9.5.2.2 `char* get_centroid_struct_pr ( int length, double * dist, double * pr )`

Get the centroid structure of the ensemble.

This function is a threadsafe replacement for `centroid()` with a probability array input

The centroid is the structure with the minimal average distance to all other structures

$$\langle d(S) \rangle = \sum_{(i,j) \in S} (1 - p_{ij}) + \sum_{(i,j) \notin S} p_{ij}$$

Thus, the centroid is simply the structure containing all pairs with  $p_{ij} > 0.5$ . The distance of the centroid to the ensemble is written to the memory addressed by `dist`.

**Parameters**

<i>in</i>	<i>length</i>	The length of the sequence
<i>out</i>	<i>dist</i>	A pointer to the distance variable where the centroid distance will be written to
<i>in</i>	<i>pr</i>	A upper triangular matrix containing base pair probabilities (access via <a href="#">iindx</a> <code>get_iindx()</code> )

**Returns**

The centroid structure of the ensemble in dot-bracket notation

## 9.6 Enumerating Suboptimal Structures

*Compute Zuker type suboptimal structures.*

#### 9.7.1 Detailed Description

#### 9.7.2 Function Documentation

##### 9.7.2.1 **SOLUTION**\* `zuckersubopt` ( const char \* *string* )

Compute Zuker type suboptimal structures.

Compute Suboptimal structures according to M. Zuker, i.e. for every possible base pair the minimum energy structure containing the resp. base pair. Returns a list of these structures and their energies.

#### Parameters

<i>string</i>	RNA sequence
---------------	--------------

#### Returns

List of zuker suboptimal structures

## 9.8 Suboptimal structures within an energy band around the MFE

Collaboration diagram for Suboptimal structures within an energy band around the MFE:

### Functions

- **SOLUTION** \* **subopt** (char \*seq, char \*structure, int delta, FILE \*fp)  
*Returns list of subopt structures or writes to fp.*
- **SOLUTION** \* **subopt\_par** (char \*seq, char \*structure, **paramT** \*parameters, int delta, int is\_constrained, int is\_circular, FILE \*fp)

### 9.8.1 Detailed Description

### 9.8.2 Function Documentation

#### 9.8.2.1 **SOLUTION**\* subopt ( char \* seq, char \* structure, int delta, FILE \* fp )

Returns list of subopt structures or writes to fp.

This function produces **all** suboptimal secondary structures within 'delta' \* 0.01 kcal/mol of the optimum. The results are either directly written to a 'fp' (if 'fp' is not NULL), or (fp==NULL) returned in a **SOLUTION** \* list terminated by an entry where the 'structure' pointer is NULL.

#### Parameters

<i>seq</i>	
<i>structure</i>	
<i>delta</i>	

<i>fp</i>	
-----------	--

Returns

**9.8.2.2 SOLUTION\*** `subopt_circ ( char * seq, char * sequence, int delta, FILE * fp )`

Returns list of circular subopt structures or writes to *fp*.

This function is similar to [subopt\(\)](#) but calculates secondary structures assuming the RNA sequence to be circular instead of linear

Parameters

<i>seq</i>	
<i>sequence</i>	
<i>delta</i>	
<i>fp</i>	

Returns

## 9.9 Stochastic backtracking in the Ensemble

#### 9.9.2 Function Documentation

##### 9.9.2.1 `char* pbacktrack ( char * sequence )`

Sample a secondary structure from the Boltzmann ensemble according its probability

#### Precondition

`pf\_fold\_par\(\)` or `pf\_fold\(\)` have to be called first to fill the partition function matrices

**Parameters**

<i>sequence</i>	The RNA sequence
-----------------	------------------

**Returns**

A sampled secondary structure in dot-bracket notation

**9.9.2.2 char\* pbacktrack\_circ ( char \* *sequence* )**

Sample a secondary structure of a circular RNA from the Boltzmann ensemble according its probability.

This function does the same as [pbacktrack\(\)](#) but assumes the RNA molecule to be circular

**Precondition**

[st\\_back](#) has to be set to 1 before calling [pf\\_fold\(\)](#) or [pf\\_fold\\_par\(\)](#)  
[pf\\_fold\\_par\(\)](#) or [pf\\_circ\\_fold\(\)](#) have to be called first to fill the partition function matrices

**Parameters**

<i>sequence</i>	The RNA sequence
-----------------	------------------

**Returns**

A sampled secondary structure in dot-bracket notation

**9.9.3 Variable Documentation****9.9.3.1 int st\_back**

Flag indicating that auxiliary arrays are needed throughout the computations. This is essential for stochastic backtracking.

Set this variable to 1 prior to a call of [pf\\_fold\(\)](#) to ensure that all matrices needed for stochastic backtracking are filled in the forward recursions

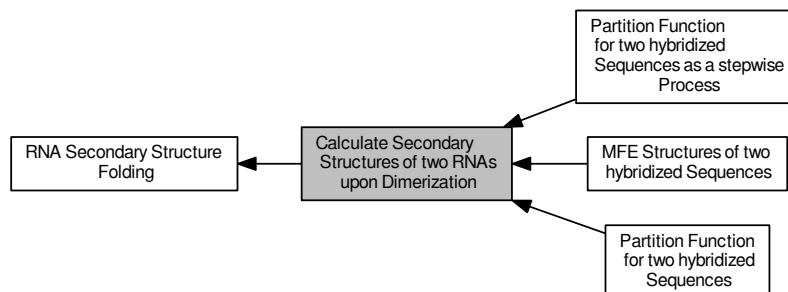

**See also**

[pbacktrack\(\)](#), [pbacktrack\\_circ](#)

## 9.10 Calculate Secondary Structures of two RNAs upon Dimerization

Predict structures formed by two molecules upon hybridization.

Collaboration diagram for Calculate Secondary Structures of two RNAs upon Dimerization:

*Partition Function Cofolding as a stepwise process.*

### 9.10.1 Detailed Description

Predict structures formed by two molecules upon hybridization.

The function of an RNA molecule often depends on its interaction with other RNAs. The following routines therefore allow to predict structures formed by two RNA molecules upon hybridization.

One approach to co-folding two RNAs consists of concatenating the two sequences and keeping track of the concatenation point in all energy evaluations. Correspondingly, many of the [cofold\(\)](#) and [co\\_pf\\_fold\(\)](#) routines below take one sequence string as argument and use the the global variable [cut\\_point](#) to mark the concatenation point. Note that while the *RNAcofold* program uses the '&' character to mark the chain break in its input, you should not use an '&' when using the library routines (set [cut\\_point](#) instead).

In a second approach to co-folding two RNAs, cofolding is seen as a stepwise process. In the first step the probability of an unpaired region is calculated and in a second step this probability of an unpaired region is multiplied with the probability of an interaction between the two RNAs. This approach is implemented for the interaction between a long target sequence and a short ligand RNA. Function [pf\\_unstru\(\)](#) calculates the partition function over all unpaired regions in the input sequence. Function [pf\\_interact\(\)](#), which calculates the partition function over all possible interactions between two sequences, needs both sequence as separate strings as input.

#### 9.11.1 Detailed Description

#### 9.11.2 Function Documentation

##### 9.11.2.1 float cofold ( const char \* sequence, char \* structure )

Compute the minimum free energy of two interacting RNA molecules.

The code is analog to the [fold\(\)](#) function. If [cut\\_point](#) == -1 results should be the same as with [fold\(\)](#).

## Parameters

<i>sequence</i>	The two sequences concatenated
<i>structure</i>	Will hold the barcket dot structure of the dimer molecule

## Returns

minimum free energy of the structure

9.11.2.2 `void export_cofold_arrays_gq ( int ** f5_p, int ** c_p, int ** fML_p, int ** fM1_p, int ** fc_p, int ** ggg_p, int ** indx_p, char ** ptype_p )`

Export the arrays of partition function cofold (with gquadruplex support)

Export the cofold arrays for use e.g. in the concentration Computations or suboptimal secondary structure backtracking

## Parameters

<i>f5_p</i>	A pointer to the 'f5' array, i.e. array containing best free energy in interval [1..j]
<i>c_p</i>	A pointer to the 'c' array, i.e. array containing best free energy in interval [i..j] given that i pairs with j
<i>fML_p</i>	A pointer to the 'M' array, i.e. array containing best free energy in interval [i..j] for any multiloop segment with at least one stem
<i>fM1_p</i>	A pointer to the 'M1' array, i.e. array containing best free energy in interval [i..j] for multiloop segment with exactly one stem
<i>fc_p</i>	A pointer to the 'fc' array, i.e. array ...
<i>ggg_p</i>	A pointer to the 'ggg' array, i.e. array containing best free energy of a gquadruplex delimited by [i..j]
<i>indx_p</i>	A pointer to the indexing array used for accessing the energy matrices
<i>ptype_p</i>	A pointer to the ptype array containing the base pair types for each possibility (i,j)

9.11.2.3 `void export_cofold_arrays ( int ** f5_p, int ** c_p, int ** fML_p, int ** fM1_p, int ** fc_p, int ** indx_p, char ** ptype_p )`

Export the arrays of partition function cofold.

Export the cofold arrays for use e.g. in the concentration Computations or suboptimal secondary structure backtracking

## Parameters

<i>f5_p</i>	A pointer to the 'f5' array, i.e. array containing best free energy in interval [1..j]
<i>c_p</i>	A pointer to the 'c' array, i.e. array containing best free energy in interval [i..j] given that i pairs with j
<i>fML_p</i>	A pointer to the 'M' array, i.e. array containing best free energy in interval [i..j] for any multiloop segment with at least one stem
<i>fM1_p</i>	A pointer to the 'M1' array, i.e. array containing best free energy in interval [i..j] for multiloop segment with exactly one stem
<i>fc_p</i>	A pointer to the 'fc' array, i.e. array ...
<i>indx_p</i>	A pointer to the indexing array used for accessing the energy matrices
<i>ptype_p</i>	A pointer to the ptype array containing the base pair types for each possibility (i,j)

*Free energies of the two monomers.*

### 9.12.1 Detailed Description

Partition Function Cofolding.

To simplify the implementation the partition function computation is done internally in a null model that does not include the duplex initiation energy, i.e. the entropic penalty for producing a dimer from two monomers). The resulting free energies and pair probabilities are initially relative to that null model. In a second step the free energies can be corrected to include the dimerization penalty, and the pair probabilities can be divided into the conditional pair probabilities given that a re dimer is formed or not formed. See [2] for further details.

### 9.12.2 Function Documentation

#### 9.12.2.1 `cofoldF co_pf_fold ( char * sequence, char * structure )`

Calculate partition function and base pair probabilities.

This is the cofold partition function folding. The second molecule starts at the [cut\\_point](#) nucleotide.

#### Note

OpenMP: Since this function relies on the global parameters [do\\_backtrack](#), [dangles](#), [temperature](#) and [pf\\_scale](#) it is not threadsafe according to concurrent changes in these variables! Use [co\\_pf\\_fold\\_par\(\)](#) instead to circumvent this issue.

#### See also

[co\\_pf\\_fold\\_par\(\)](#)

#### Parameters

<i>sequence</i>	Concatenated RNA sequences
<i>structure</i>	Will hold the structure or constraints

#### Returns

[cofoldF](#) structure containing a set of energies needed for concentration computations.

#### 9.12.2.2 `cofoldF co_pf_fold_par ( char * sequence, char * structure, pf_paramT * parameters, int calculate_bppm, int is_constrained )`

Calculate partition function and base pair probabilities.

This is the cofold partition function folding. The second molecule starts at the [cut\\_point](#) nucleotide.

#### See also

[get\\_boltzmann\\_factors\(\)](#), [co\\_pf\\_fold\(\)](#)

## Parameters

<i>sequence</i>	Concatenated RNA sequences
<i>structure</i>	Pointer to the structure constraint
<i>parameters</i>	Data structure containing the precalculated Boltzmann factors
<i>calculate_bppm</i>	Switch to turn Base pair probability calculations on/off (0==off)
<i>is_constrained</i>	Switch to indicate that a structure constraint is passed via the structure argument (0==off)

## Returns

[cofoldF](#) structure containing a set of energies needed for concentration computations.

9.12.2.3 `double* export_co_bppm ( void )`

Get a pointer to the base pair probability array.

Accessing the base pair probabilities for a pair (i,j) is achieved by

```
FLT_OR_DBL *pr = export_bppm(); pr_ij = pr[iindx[i]-j];
```

## See also

[get\\_iindx\(\)](#)

## Returns

A pointer to the base pair probability array

9.12.2.4 `void update_co_pf_params ( int length )`

Recalculate energy parameters.

This function recalculates all energy parameters given the current model settings.

## Note

This function relies on the global variables [pf\\_scale](#), [dangles](#) and [temperature](#). Thus it might not be threadsafe in certain situations. Use [update\\_co\\_pf\\_params\\_par\(\)](#) instead.

## See also

[get\\_boltzmann\\_factors\(\)](#), [update\\_co\\_pf\\_params\\_par\(\)](#)

## Parameters

<i>length</i>	Length of the current RNA sequence
---------------	------------------------------------

9.12.2.5 `void update_co_pf_params_par ( int length, pf_paramT * parameters )`

Recalculate energy parameters.

This function recalculates all energy parameters given the current model settings. It's second argument can either be NULL or a data structure containing the precomputed Boltzmann factors. In the first scenario, the necessary data structure will be created automatically according to the current global model settings, i.e. this mode might not be threadsafe. However, if the provided data structure is not NULL, threadsafety for the model parameters [dangles](#), [pf\\_scale](#) and [temperature](#) is regained, since their values are taken from this data structure during subsequent calculations.

See also

[get\\_boltzmann\\_factors\(\)](#), [update\\_co\\_pf\\_params\(\)](#)

Parameters

<i>length</i>	Length of the current RNA sequence
<i>parameters</i>	data structure containing the precomputed Boltzmann factors

9.12.2.6 `void compute_probabilities ( double FAB, double FEA, double FEB, struct plist * prAB, struct plist * prA, struct plist * prB, int Alength )`

Compute Boltzmann probabilities of dimerization without homodimers.

Given the pair probabilities and free energies (in the null model) for a dimer AB and the two constituent monomers A and B, compute the conditional pair probabilities given that a dimer AB actually forms. Null model pair probabilities are given as a list as produced by [assign\\_plist\\_from\\_pr\(\)](#), the dimer probabilities 'prAB' are modified in place.

Parameters

<i>FAB</i>	free energy of dimer AB
<i>FEA</i>	free energy of monomer A
<i>FEB</i>	free energy of monomer B
<i>prAB</i>	pair probabilities for dimer
<i>prA</i>	pair probabilities monomer
<i>prB</i>	pair probabilities monomer
<i>Alength</i>	Length of molecule A

9.12.2.7 `ConcEnt* get_concentrations ( double FEAB, double FEAA, double FEBB, double FEA, double FEB, double * startconc )`

Given two start monomer concentrations a and b, compute the concentrations in thermodynamic equilibrium of all dimers and the monomers.

This function takes an array 'startconc' of input concentrations with alternating entries for the initial concentrations of molecules A and B (terminated by two zeroes), then computes the resulting equilibrium concentrations from the free energies for the dimers. Dimer free energies should be the dimer-only free energies, i.e. the FcAB entries from the [cofoldF](#) struct.

Parameters

<i>FEAB</i>	Free energy of AB dimer (FcAB entry)
<i>FEAA</i>	Free energy of AA dimer (FcAB entry)
<i>FEBB</i>	Free energy of BB dimer (FcAB entry)
<i>FEA</i>	Free energy of monomer A
<i>FEB</i>	Free energy of monomer B
<i>startconc</i>	List of start concentrations [a0],[b0],[a1],[b1],...,[an],[bn],[0],[0]

Returns

[ConcEnt](#) array containing the equilibrium energies and start concentrations

## 9.13 Partition Function for two hybridized Sequences as a stepwise Process

*Frees the output of function [pf\\_unstru\(\)](#).*

### 9.13.1 Detailed Description

Partition Function Cofolding as a stepwise process.

### 9.13.2 Function Documentation

#### 9.13.2.1 [pu\\_contrib](#)\* [pf\\_unstru](#) ( char \* *sequence*, int *max\_w* )

Calculate the partition function over all unpaired regions of a maximal length.

You have to call function [pf\\_fold\(\)](#) providing the same sequence before calling [pf\\_unstru\(\)](#). If you want to calculate unpaired regions for a constrained structure, set variable 'structure' in function '[pf\\_fold\(\)](#)' to the constrain string. It returns a [pu\\_contrib](#) struct containing four arrays of dimension [i = 1 to length(sequence)][j = 0 to u-1] containing all possible contributions to the probabilities of unpaired regions of maximum length u. Each array in [pu\\_contrib](#) contains one of the contributions to the total probability of being unpaired: The probability of being unpaired within

an exterior loop is in array `pu_contrib->E`, the probability of being unpaired within a hairpin loop is in array `pu_contrib->H`, the probability of being unpaired within an interior loop is in array `pu_contrib->I` and probability of being unpaired within a multi-loop is in array `pu_contrib->M`. The total probability of being unpaired is the sum of the four arrays of `pu_contrib`.

This function frees everything allocated automatically. To free the output structure call `free_pu_contrib()`.

#### Parameters

<i>sequence</i>	
<i>max_w</i>	

#### Returns

**9.13.2.2** `interact* pf_interact ( const char * s1, const char * s2, pu_contrib * p_c, pu_contrib * p_c2, int max_w, char * cstruc, int incr3, int incr5 )`

Calculates the probability of a local interaction between two sequences.

The function considers the probability that the region of interaction is unpaired within 's1' and 's2'. The longer sequence has to be given as 's1'. The shorter sequence has to be given as 's2'. Function `pf_unstru()` has to be called for 's1' and 's2', where the probabilities of being unpaired have to be given in 'p\_c' and 'p\_c2', respectively. If you do not want to include the probabilities of being unpaired for 's2' set 'p\_c2' to NULL. If variable 'cstruc' is not NULL, constrained folding is done: The available constraints for intermolecular interaction are: '.' (no constrain), 'x' (the base has no intermolecular interaction) and '|' (the corresponding base has to be paired intermolecularly).

The parameter 'w' determines the maximal length of the interaction. The parameters 'incr5' and 'incr3' allows inclusion of unpaired residues left ('incr5') and right ('incr3') of the region of interaction in 's1'. If the 'incr' options are used, function `pf_unstru()` has to be called with  $w=w+incr5+incr3$  for the longer sequence 's1'.

It returns a structure of type `interact` which contains the probability of the best local interaction including residue *i* in  $P_i$  and the minimum free energy in  $G_i$ , where *i* is the position in sequence 's1'. The member  $G_{ikjl}$  of structure `interact` is the best interaction between region  $[k,i]$   $k < i$  in longer sequence 's1' and region  $[j,l]$   $j < l$  in 's2'.  $G_{ikjl\_wo}$  is  $G_{ikjl}$  without the probability of being unpaired.

Use `free_interact()` to free the returned structure, all other stuff is freed inside `pf_interact()`.

#### Parameters

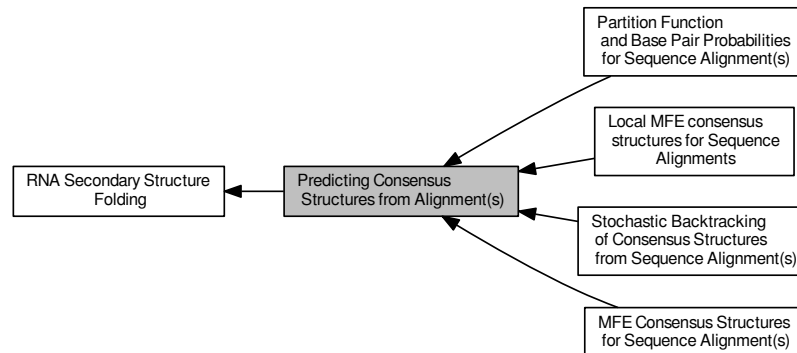

<i>s1</i>	
<i>s2</i>	
<i>p_c</i>	
<i>p_c2</i>	
<i>max_w</i>	
<i>cstruc</i>	
<i>incr3</i>	
<i>incr5</i>	

#### Returns

### 9.14.1 Detailed Description

compute various properties (consensus MFE structures, partition function, Boltzmann distributed stochastic samples, ...) for RNA sequence alignments

Consensus structures can be predicted by a modified version of the [fold\(\)](#) algorithm that takes a set of aligned sequences instead of a single sequence. The energy function consists of the mean energy averaged over the sequences, plus a covariance term that favors pairs with consistent and compensatory mutations and penalizes pairs that cannot be formed by all structures. For details see [\[4\]](#) and [\[1\]](#).

### 9.14.2 Function Documentation

#### 9.14.2.1 int get\_mpi ( char \* *Alseq*[], int *n\_seq*, int *length*, int \* *mini* )

Get the mean pairwise identity in steps from ?to?(ident)

##### Parameters

<i>Alseq</i>	
<i>n_seq</i>	The number of sequences in the alignment
<i>length</i>	The length of the alignment
<i>mini</i>	

##### Returns

The mean pairwise identity

#### 9.14.2.2 float energy\_of\_alistruct ( const char \*\* *sequences*, const char \* *structure*, int *n\_seq*, float \* *energy* )

Calculate the free energy of a consensus structure given a set of aligned sequences.

##### Parameters

<i>sequences</i>	The NULL terminated array of sequences
<i>structure</i>	The consensus structure
<i>n_seq</i>	The number of sequences in the alignment
<i>energy</i>	A pointer to an array of at least two floats that will hold the free energies (energy[0] will contain the free energy, energy[1] will be filled with the covariance energy term)

##### Returns

free energy in kcal/mol

9.14.2.3 `void encode_ali_sequence ( const char * sequence, short * S, short * s5, short * s3, char * ss, unsigned short * as, int circ )`

Get arrays with encoded sequence of the alignment.

this function assumes that in *S*, *S5*, *s3*, *ss* and *as* enough space is already allocated (size must be at least sequence length+2)

#### Parameters

<i>sequence</i>	The gapped sequence from the alignment
<i>S</i>	pointer to an array that holds encoded sequence
<i>s5</i>	pointer to an array that holds the next base 5' of alignment position i
<i>s3</i>	pointer to an array that holds the next base 3' of alignment position i
<i>ss</i>	
<i>as</i>	
<i>circ</i>	assume the molecules to be circular instead of linear (circ=0)

9.14.2.4 `void alloc_sequence_arrays ( const char ** sequences, short *** S, short *** S5, short *** S3, unsigned short *** a2s, char *** Ss, int circ )`

Allocate memory for sequence array used to deal with aligned sequences.

Note that these arrays will also be initialized according to the sequence alignment given

See also

[free\\_sequence\\_arrays\(\)](#)

#### Parameters

<i>sequences</i>	The aligned sequences
<i>S</i>	A pointer to the array of encoded sequences
<i>S5</i>	A pointer to the array that contains the next 5' nucleotide of a sequence position
<i>S3</i>	A pointer to the array that contains the next 3' nucleotide of a sequence position
<i>a2s</i>	A pointer to the array that contains the alignment to sequence position mapping
<i>Ss</i>	A pointer to the array that contains the ungapped sequence
<i>circ</i>	assume the molecules to be circular instead of linear (circ=0)

9.14.2.5 `void free_sequence_arrays ( unsigned int n_seq, short *** S, short *** S5, short *** S3, unsigned short *** a2s, char *** Ss )`

Free the memory of the sequence arrays used to deal with aligned sequences.

This function frees the memory previously allocated with [alloc\\_sequence\\_arrays\(\)](#)

See also

[alloc\\_sequence\\_arrays\(\)](#)

#### Parameters

<i>n_seq</i>	The number of aligned sequences
<i>S</i>	A pointer to the array of encoded sequences

<i>S5</i>	A pointer to the array that contains the next 5' nucleotide of a sequence position
<i>S3</i>	A pointer to the array that contains the next 3' nucleotide of a sequence position
<i>a2s</i>	A pointer to the array that contains the alignment to sequence position mapping
<i>Ss</i>	A pointer to the array that contains the ungapped sequence

9.14.2.6 `int get_alipf_arrays ( short *** S_p, short *** S5_p, short *** S3_p, unsigned short *** a2s_p, char *** Ss_p, double ** qb_p, double ** qm_p, double ** q1k_p, double ** qln_p, short ** pscore )`

Get pointers to (almost) all relevant arrays used in alifold's partition function computation.

#### Note

To obtain meaningful pointers, call `alipf_fold` first!

#### See also

`pf_alifold()`, [alipf\\_circ\\_fold\(\)](#)

#### Parameters

<i>S_p</i>	A pointer to the 'S' array (integer representation of nucleotides)
<i>S5_p</i>	A pointer to the 'S5' array
<i>S3_p</i>	A pointer to the 'S3' array
<i>a2s_p</i>	A pointer to the pair type matrix
<i>Ss_p</i>	A pointer to the 'Ss' array
<i>qb_p</i>	A pointer to the $Q^B$ matrix
<i>qm_p</i>	A pointer to the $Q^M$ matrix
<i>q1k_p</i>	A pointer to the 5' slice of the Q matrix ( $q1k(k) = Q(1, k)$ )
<i>qln_p</i>	A pointer to the 3' slice of the Q matrix ( $qln(l) = Q(l, n)$ )

#### Returns

Non Zero if everything went fine, 0 otherwise

### 9.14.3 Variable Documentation

#### 9.14.3.1 `double cv_fact`

This variable controls the weight of the covariance term in the energy function of alignment folding algorithms.

Default is 1.

#### 9.14.3.2 `double nc_fact`

This variable controls the magnitude of the penalty for non-compatible sequences in the covariance term of alignment folding algorithms.

Default is 1.

## 9.15 MFE Consensus Structures for Sequence Alignment(s)

### 9.15.1 Detailed Description

### 9.15.2 Function Documentation

#### 9.15.2.1 float alifold ( const char \*\* strings, char \* structure )

Compute MFE and according consensus structure of an alignment of sequences.

This function predicts the consensus structure for the aligned 'sequences' and returns the minimum free energy; the mfe structure in bracket notation is returned in 'structure'.

Sufficient space must be allocated for 'structure' before calling [alifold\(\)](#).

#### Parameters

<i>strings</i>	A pointer to a NULL terminated array of character arrays
<i>structure</i>	A pointer to a character array that may contain a constraining consensus structure (will be overwritten by a consensus structure that exhibits the MFE)

#### Returns

The free energy score in kcal/mol

#### 9.15.2.2 float circaifold ( const char \*\* strings, char \* structure )

Compute MFE and according structure of an alignment of sequences assuming the sequences are circular instead of linear.

## Parameters

<i>strings</i>	A pointer to a NULL terminated array of character arrays
<i>structure</i>	A pointer to a character array that may contain a constraining consensus structure (will be overwritten by a consensus structure that exhibits the MFE)

## Returns

The free energy score in kcal/mol

## 9.16 Partition Function and Base Pair Probabilities for Sequence Alignment(s)

Collaboration diagram for Partition Function and Base Pair Probabilities for Sequence Alignment(s):

### Functions

- float [alipf\\_fold\\_par](#) (const char \*\*sequences, char \*structure, [plist](#) \*\*pl, [pf\\_paramT](#) \*parameters, int calculate\_bppm, int is\_constrained, int is\_circular)
- float [alipf\\_fold](#) (const char \*\*sequences, char \*structure, [plist](#) \*\*pl)
 

*The partition function version of [alifold\(\)](#) works in analogy to [pf\\_fold\(\)](#). Pair probabilities and information about sequence covariations are returned via the 'pi' variable as a list of [pair\\_info](#) structs. The list is terminated by the first entry with pi.i = 0.*
- float [alipf\\_circ\\_fold](#) (const char \*\*sequences, char \*structure, [plist](#) \*\*pl)
- double \* [export\\_ali\\_bppm](#) (void)
 

*Get a pointer to the base pair probability array.*

### 9.16.1 Detailed Description

### 9.16.2 Function Documentation

9.16.2.1 float [alipf\\_fold\\_par](#) ( const char \*\* sequences, char \* structure, [plist](#) \*\* pl, [pf\\_paramT](#) \* parameters, int calculate\_bppm, int is\_constrained, int is\_circular )

#### Parameters

<i>sequences</i>	
<i>structure</i>	
<i>pl</i>	
<i>parameters</i>	
<i>calculate_bppm</i>	
<i>is_constrained</i>	
<i>is_circular</i>	

#### Returns

9.16.2.2 float [alipf\\_fold](#) ( const char \*\* sequences, char \* structure, [plist](#) \*\* pl )

The partition function version of [alifold\(\)](#) works in analogy to [pf\\_fold\(\)](#). Pair probabilities and information about sequence covariations are returned via the 'pi' variable as a list of [pair\\_info](#) structs. The list is terminated by the first entry with pi.i = 0.

## Parameters

<i>sequences</i>	
<i>structure</i>	
<i>pl</i>	

## Returns

9.16.2.3 float alipf\_circ\_fold ( const char \*\* *sequences*, char \* *structure*, plist \*\* *pl* )

## Parameters

<i>sequences</i>	
<i>structure</i>	
<i>pl</i>	

## Returns

## 9.16.2.4 double\* export\_ali\_bppm ( void )

Get a pointer to the base pair probability array.

Accessing the base pair probabilities for a pair (i,j) is achieved by

```
FLT_OR_DBL *pr = export_bppm(); pr_ij = pr[iindx[i]-j];
```

## See also

[get\\_iindx\(\)](#)

## Returns

A pointer to the base pair probability array

## 9.17 Stochastic Backtracking of Consensus Structures from Sequence Alignment(s)

Collaboration diagram for Stochastic Backtracking of Consensus Structures from Sequence Alignment(s):

### Functions

- `char * alipbacktrack (double *prob)`  
*Sample a consensus secondary structure from the Boltzmann ensemble according its probability*

#### 9.17.1 Detailed Description

#### 9.17.2 Function Documentation

##### 9.17.2.1 `char* alipbacktrack ( double * prob )`

Sample a consensus secondary structure from the Boltzmann ensemble according its probability

.

#### Parameters

<i>prob</i>	to be described (berni)
-------------	-------------------------

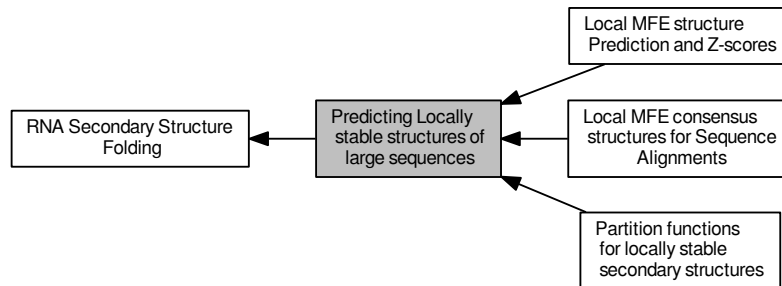

#### Returns

A sampled consensus secondary structure in dot-bracket notation

## 9.18 Predicting Locally stable structures of large sequences

Collaboration diagram for Predicting Locally stable structures of large sequences:

*Predicting local MFE structures of large sequences.*

### 9.18.1 Detailed Description

Local structures can be predicted by a modified version of the [fold\(\)](#) algorithm that restricts the span of all base pairs.

## 9.19 Local MFE structure Prediction and Z-scores

Collaboration diagram for Local MFE structure Prediction and Z-scores:

### Functions

- float [Lfold](#) (const char \*string, char \*structure, int maxdist)  
The local analog to [fold\(\)](#).
- float [Lfoldz](#) (const char \*string, char \*structure, int maxdist, int zsc, double min\_z)

### 9.19.1 Detailed Description

### 9.19.2 Function Documentation

#### 9.19.2.1 float Lfold ( const char \* *string*, char \* *structure*, int *maxdist* )

The local analog to [fold\(\)](#).

Computes the minimum free energy structure including only base pairs with a span smaller than 'maxdist'

Parameters

<i>string</i>	
<i>structure</i>	
<i>maxdist</i>	

#### 9.19.2.2 float Lfoldz ( const char \* *string*, char \* *structure*, int *maxdist*, int *zsc*, double *min\_z* )

Parameters

<i>string</i>	
<i>structure</i>	
<i>maxdist</i>	
<i>zsc</i>	
<i>min_z</i>

*Writes the unpaired probabilities (pU) or opening energies into a binary file.*

### 9.20.1 Detailed Description

### 9.20.2 Function Documentation

#### 9.20.2.1 void [update\\_pf\\_paramsLP](#) ( int length )

Parameters

<i>length</i>	
---------------	--

#### 9.20.2.2 [plist\\* pfl\\_fold](#) ( char \* *sequence*, int *winSize*, int *pairSize*, float *cutoffb*, double \*\* *pU*, struct [plist](#) \*\* *dpp2*, FILE \* *pUfp*, FILE \* *spup* )

Compute partition functions for locally stable secondary structures.

`pfl_fold` computes partition functions for every window of size '`winSize`' possible in a RNA molecule, allowing only pairs with a span smaller than '`pairSize`'. It returns the mean pair probabilities averaged over all windows containing the pair in '`pl`'. '`winSize`' should always be  $\geq$  '`pairSize`'. Note that in contrast to `Lfold()`, bases outside of the window do not influence the structure at all. Only probabilities higher than '`cutoffb`' are kept.

If '`pU`' is supplied (i.e. is not the NULL pointer), `pfl_fold()` will also compute the mean probability that regions of length '`u`' and smaller are unpaired. The parameter '`u`' is supplied in '`pup[0][0]`'. On return the '`pup`' array will contain these probabilities, with the entry on '`pup[x][y]`' containing the mean probability that `x` and the `y-1` preceding bases are unpaired. The '`pU`' array needs to be large enough to hold `n+1 float*` entries, where `n` is the sequence length.

If an array `dpp2` is supplied, the probability of base pair (`i,j`) given that there already exists a base pair (`i+1,j-1`) is also computed and saved in this array. If `pUfp` is given (i.e. not NULL), `pU` is not saved but put out immediately. If `spup` is given (i.e. is not NULL), the pair probabilities in `pl` are not saved but put out immediately.

#### Parameters

<i>sequence</i>	RNA sequence
<i>winSize</i>	size of the window
<i>pairSize</i>	maximum size of base pair
<i>cutoffb</i>	cutoffb for base pairs
<i>pU</i>	array holding all unpaired probabilities
<i>dpp2</i>	array of dependent pair probabilities
<i>pUfp</i>	file pointer for pU
<i>spup</i>	file pointer for pair probabilities

#### Returns

list of pair probabilities

#### 9.20.2.3 void putoutpU\_prob ( double \*\* *pU*, int *length*, int *ulength*, FILE \* *fp*, int *energies* )

Writes the unpaired probabilities (`pU`) or opening energies into a file.

Can write either the unpaired probabilities (accessibilities) `pU` or the opening energies  $-\log(pU)kT$  into a file

#### Parameters

<i>pU</i>	pair probabilities
<i>length</i>	length of RNA sequence
<i>ulength</i>	maximum length of unpaired stretch
<i>fp</i>	file pointer of destination file
<i>energies</i>	switch to put out as opening energies

#### 9.20.2.4 void putoutpU\_prob\_bin ( double \*\* *pU*, int *length*, int *ulength*, FILE \* *fp*, int *energies* )

Writes the unpaired probabilities (`pU`) or opening energies into a binary file.

Can write either the unpaired probabilities (accessibilities) `pU` or the opening energies  $-\log(pU)kT$  into a file

#### Parameters

<i>pU</i>	pair probabilities
<i>length</i>	length of RNA sequence
<i>ulength</i>	maximum length of unpaired stretch
<i>fp</i>	file pointer of destination file

<i>energies</i>	switch to put out as opening energies
-----------------	---------------------------------------

#### 9.22.1 Detailed Description

All relevant functions to retrieve and copy precalculated energy parameter sets as well as reading/writing the energy parameter set from/to file(s).

This module covers all relevant functions for precalculation of the energy parameters necessary for the folding routines provided by RNAlib. Furthermore, the energy parameter set in the RNAlib can be easily exchanged by a user-defined one. It is also possible to write the current energy parameter set into a text file.

## 9.22.2 Function Documentation

### 9.22.2.1 `paramT* scale_parameters ( void )`

Get precomputed energy contributions for all the known loop types.

#### Note

OpenMP: This function relies on several global model settings variables and thus is not to be considered threadsafe. See [get\\_scaled\\_parameters\(\)](#) for a completely threadsafe implementation.

#### Returns

A set of precomputed energy contributions

### 9.22.2.2 `paramT* get_scaled_parameters ( double temperature, model_detailsT md )`

Get precomputed energy contributions for all the known loop types.

Call this function to retrieve precomputed energy contributions, i.e. scaled according to the temperature passed. Furthermore, this function assumes a data structure that contains the model details as well, such that subsequent folding recursions are able to retrieve the correct model settings

#### See also

[model\\_detailsT](#), [set\\_model\\_details\(\)](#)

#### Parameters

<i>temperature</i>	The temperature in degrees Celcius
<i>md</i>	The model details

#### Returns

precomputed energy contributions and model settings

### 9.22.2.3 `pf_paramT* get_scaled_pf_parameters ( void )`

get a datastructure of type [pf\\_paramT](#) which contains the Boltzmann weights of several energy parameters scaled according to the current temperature

#### Returns

The datastructure containing Boltzmann weights for use in partition function calculations

### 9.22.2.4 `pf_paramT* get_boltzmann_factors ( double temperature, double betaScale, model_detailsT md, double pf_scale )`

Get precomputed Boltzmann factors of the loop type dependent energy contributions with independent thermodynamic temperature.

This function returns a data structure that contains all necessary precalculated Boltzmann factors for each loop type contribution.

In contrast to [get\\_scaled\\_pf\\_parameters\(\)](#), this function enables setting of independent temperatures for both, the individual energy contributions as well as the thermodynamic temperature used in  $\exp(-\Delta G/kT)$

#### See also

[get\\_scaled\\_pf\\_parameters\(\)](#), [get\\_boltzmann\\_factor\\_copy\(\)](#)

## Parameters

<i>temperature</i>	The temperature in degrees Celcius used for (re-)scaling the energy contributions
<i>betaScale</i>	A scaling value that is used as a multiplication factor for the absolute temperature of the system
<i>md</i>	The model details to be used
<i>pf_scale</i>	The scaling factor for the Boltzmann factors

## Returns

A set of precomputed Boltzmann factors

9.22.2.5 `pf_paramT* get_boltzmann_factor_copy ( pf_paramT * parameters )`

Get a copy of already precomputed Boltzmann factors.

## See also

[get\\_boltzmann\\_factors\(\)](#), [get\\_scaled\\_pf\\_parameters\(\)](#)

## Parameters

<i>parameters</i>	The input data structure that shall be copied
-------------------	---

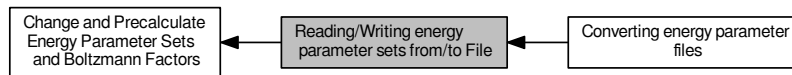

## Returns

A copy of the provided Boltzmann factor dataset

## 9.23 Reading/Writing energy parameter sets from/to File

Read and Write energy parameter sets from and to text files.

Collaboration diagram for Reading/Writing energy parameter sets from/to File:

### Modules

- [Converting energy parameter files](#)

*Convert energy parameter files into the latest format.*

### Files

- file [read\\_epars.h](#)

### Enumerations

- enum [parset](#)

*Identifiers for energy contribution parameters in parameter files.*

### Functions

- void [read\\_parameter\\_file](#) (const char fname[ ])  
*Read energy parameters from a file.*
- void [write\\_parameter\\_file](#) (const char fname[ ])  
*Write energy parameters to a file.*

#### 9.23.1 Detailed Description

Read and Write energy parameter sets from and to text files.

A default set of parameters, identical to the one described in [9] and [13], is compiled into the library.

#### 9.23.2 Enumeration Type Documentation

##### 9.23.2.1 enum parset

Identifiers for energy contribution parameters in parameter files.

DO NOT ALTER THEIR ORDER unless you are also reordering the char pointers in the const array 'identifier' in read\_epars.c!!!

### 9.23.3 Function Documentation

#### 9.23.3.1 void read\_parameter\_file ( const char *fname*[ ] )

Read energy parameters from a file.

**Parameters**

<i>fname</i>	The path to the file containing the energy parameters
--------------	---

**9.23.3.2 void write\_parameter\_file ( const char *fname*[] )**

Write energy parameters to a file.

**Parameters**

<i>fname</i>	A filename (path) for the file where the current energy parameters will be written to
--------------	---

## 9.24 Converting energy parameter files

Convert energy parameter files into the latest format.

Collaboration diagram for Converting energy parameter files:

### Files

- file [convert\\_epars.h](#)

*Functions and definitions for energy parameter file format conversion.*

### Macros

- `#define VRNA_CONVERT_OUTPUT_ALL 1U`

- `#define VRNA_CONVERT_OUTPUT_DUMP 2097152U`

### Functions

- void [convert\\_parameter\\_file](#) (const char \*iname, const char \*oname, unsigned int options)

### 9.24.1 Detailed Description

Convert energy parameter files into the latest format.

To preserve some backward compatibility the RNAlib also provides functions to convert energy parameter files from the format used in version 1.4-1.8 into the new format used since version 2.0

### 9.24.2 Macro Definition Documentation

#### 9.24.2.1 `#define VRNA_CONVERT_OUTPUT_ALL 1U`

Flag to indicate printing of a complete parameter set

#### 9.24.2.2 `#define VRNA_CONVERT_OUTPUT_HP 2U`

Flag to indicate printing of hairpin contributions

#### 9.24.2.3 `#define VRNA_CONVERT_OUTPUT_STACK 4U`

Flag to indicate printing of base pair stack contributions

#### 9.24.2.4 `#define VRNA_CONVERT_OUTPUT_MM_HP 8U`

Flag to indicate printing of hairpin mismatch contribution

#### 9.24.2.5 `#define VRNA_CONVERT_OUTPUT_MM_INT 16U`

Flag to indicate printing of interior loop mismatch contribution

#### 9.24.2.6 `#define VRNA_CONVERT_OUTPUT_MM_INT_1N 32U`

Flag to indicate printing of 1:n interior loop mismatch contribution

#### 9.24.2.7 `#define VRNA_CONVERT_OUTPUT_MM_INT_23 64U`

Flag to indicate printing of 2:3 interior loop mismatch contribution

#### 9.24.2.8 `#define VRNA_CONVERT_OUTPUT_MM_MULTI 128U`

Flag to indicate printing of multi loop mismatch contribution

#### 9.24.2.9 `#define VRNA_CONVERT_OUTPUT_MM_EXT 256U`

Flag to indicate printing of exterior loop mismatch contribution

#### 9.24.2.10 `#define VRNA_CONVERT_OUTPUT_DANGLE5 512U`

Flag to indicate printing of 5' dangle contribution

9.24.2.11 `#define VRNA_CONVERT_OUTPUT_DANGLE3 1024U`

Flag to indicate printing of 3' dangle contribution

9.24.2.12 `#define VRNA_CONVERT_OUTPUT_INT_11 2048U`

Flag to indicate printing of 1:1 interior loop contribution

9.24.2.13 `#define VRNA_CONVERT_OUTPUT_INT_21 4096U`

Flag to indicate printing of 2:1 interior loop contribution

9.24.2.14 `#define VRNA_CONVERT_OUTPUT_INT_22 8192U`

Flag to indicate printing of 2:2 interior loop contribution

9.24.2.15 `#define VRNA_CONVERT_OUTPUT_BULGE 16384U`

Flag to indicate printing of bulge loop contribution

9.24.2.16 `#define VRNA_CONVERT_OUTPUT_INT 32768U`

Flag to indicate printing of interior loop contribution

9.24.2.17 `#define VRNA_CONVERT_OUTPUT_ML 65536U`

Flag to indicate printing of multi loop contribution

9.24.2.18 `#define VRNA_CONVERT_OUTPUT_MISC 131072U`

Flag to indicate printing of misc contributions (such as terminalAU)

9.24.2.19 `#define VRNA_CONVERT_OUTPUT_SPECIAL_HP 262144U`

Flag to indicate printing of special hairpin contributions (tri-, tetra-, hexa-loops)

9.24.2.20 `#define VRNA_CONVERT_OUTPUT_VANILLA 524288U`

Flag to indicate printing of given parameters only

#### Note

This option overrides all other output options, except [VRNA\\_CONVERT\\_OUTPUT\\_DUMP](#) !

9.24.2.21 `#define VRNA_CONVERT_OUTPUT_NINIO 1048576U`

Flag to indicate printing of interior loop asymmetry contribution

#### 9.24.2.22 #define VRNA\_CONVERT\_OUTPUT\_DUMP 2097152U

Flag to indicate dumping the energy contributions from the library instead of an input file

### 9.24.3 Function Documentation

#### 9.24.3.1 void convert\_parameter\_file ( const char \* *iname*, const char \* *oname*, unsigned int *options* )

Convert/dump a Vienna 1.8.4 formatted energy parameter file

The options argument allows to control the different output modes.

Currently available options are:

- `VRNA_CONVERT_OUTPUT_ALL`, `VRNA_CONVERT_OUTPUT_HP`, `VRNA_CONVERT_OUTPUT_STACK`
- `VRNA_CONVERT_OUTPUT_MM_HP`, `VRNA_CONVERT_OUTPUT_MM_INT`, `VRNA_CONVERT_OUTPUT_MM_INT_1N`
- `VRNA_CONVERT_OUTPUT_MM_INT_23`, `VRNA_CONVERT_OUTPUT_MM_MULTI`, `VRNA_CONVERT_OUTPUT_MM_EXT`
- `VRNA_CONVERT_OUTPUT_DANGLE5`, `VRNA_CONVERT_OUTPUT_DANGLE3`, `VRNA_CONVERT_OUTPUT_INT_11`
- `VRNA_CONVERT_OUTPUT_INT_21`, `VRNA_CONVERT_OUTPUT_INT_22`, `VRNA_CONVERT_OUTPUT_INT_BULGE`
- `VRNA_CONVERT_OUTPUT_INT`, `VRNA_CONVERT_OUTPUT_ML`, `VRNA_CONVERT_OUTPUT_MISC`
- `VRNA_CONVERT_OUTPUT_SPECIAL_HP`, `VRNA_CONVERT_OUTPUT_VANILLA`, `VRNA_CONVERT_OUTPUT_NINIO`
- `VRNA_CONVERT_OUTPUT_DUMP`

The defined options are fine for bitwise compare- and assignment-operations, e. g.: pass a collection of options as a single value like this:

```
convert_parameter_file(ifile, ofile, option_1 | option_2 | option_n)
```

#### Parameters

<i>iname</i>	The input file name (If NULL input is read from stdin)
<i>oname</i>	The output file name (If NULL output is written to stdout)
<i>options</i>	The options (as described above)

## 9.25 Energy evaluation

This module contains all functions and variables related to energy evaluation of sequence/structure pairs.

Collaboration diagram for Energy evaluation:

### Functions

- float `energy_of_structure` (const char \*string, const char \*structure, int verbosity\_level)  
*Calculate the free energy of an already folded RNA using global model detail settings.*
- float `energy_of_struct_par` (const char \*string, const char \*structure, paramT \*parameters, int verbosity\_level)  
*Calculate the free energy of an already folded RNA.*
- float `energy_of_circ_structure` (const char \*string, const char \*structure, int verbosity\_level)  
*Calculate the free energy of an already folded circular RNA.*
- float `energy_of_circ_struct_par` (const char \*string, const char \*structure, paramT \*parameters, int verbosity\_level)  
*Calculate the free energy of an already folded circular RNA.*
- int `energy_of_structure_pt` (const char \*string, short \*ptable, short \*s, short \*s1, int verbosity\_level)  
*Calculate the free energy of an already folded RNA.*
- int `energy_of_struct_pt_par` (const char \*string, short \*ptable, short \*s, short \*s1, paramT \*parameters, int verbosity\_level)  
*Calculate the free energy of an already folded RNA.*

### Variables

- int `eos_debug`  
*verbose info from energy\_of\_struct*

#### 9.25.1 Detailed Description

This module contains all functions and variables related to energy evaluation of sequence/structure pairs.

#### 9.25.2 Function Documentation

##### 9.25.2.1 float energy\_of\_structure ( const char \* string, const char \* structure, int verbosity\_level )

Calculate the free energy of an already folded RNA using global model detail settings.

If verbosity level is set to a value >0, energies of structure elements are printed to stdout

**Note**

OpenMP: This function relies on several global model settings variables and thus is not to be considered threadsafe. See [energy\\_of\\_struct\\_par\(\)](#) for a completely threadsafe implementation.

**See also**

[energy\\_of\\_struct\\_par\(\)](#), [energy\\_of\\_circ\\_structure\(\)](#)

**Parameters**

<i>string</i>	RNA sequence
<i>structure</i>	secondary structure in dot-bracket notation
<i>verbosity_level</i>	a flag to turn verbose output on/off

**Returns**

the free energy of the input structure given the input sequence in kcal/mol

9.25.2.2 float `energy_of_struct_par` ( const char \* *string*, const char \* *structure*, paramT \* *parameters*, int *verbosity\_level* )

Calculate the free energy of an already folded RNA.

If verbosity level is set to a value >0, energies of structure elements are printed to stdout

**See also**

[energy\\_of\\_circ\\_structure\(\)](#), [energy\\_of\\_structure\\_pt\(\)](#), [get\\_scaled\\_parameters\(\)](#)

**Parameters**

<i>string</i>	RNA sequence in uppercase letters
<i>structure</i>	Secondary structure in dot-bracket notation
<i>parameters</i>	A data structure containing the prescaled energy contributions and the model details.
<i>verbosity_level</i>	A flag to turn verbose output on/off

**Returns**

The free energy of the input structure given the input sequence in kcal/mol

9.25.2.3 float `energy_of_circ_structure` ( const char \* *string*, const char \* *structure*, int *verbosity\_level* )

Calculate the free energy of an already folded circular RNA.

**Note**

OpenMP: This function relies on several global model settings variables and thus is not to be considered threadsafe. See [energy\\_of\\_circ\\_struct\\_par\(\)](#) for a completely threadsafe implementation.

If verbosity level is set to a value >0, energies of structure elements are printed to stdout

**See also**

[energy\\_of\\_circ\\_struct\\_par\(\)](#), [energy\\_of\\_struct\\_par\(\)](#)

## Parameters

<i>string</i>	RNA sequence
<i>structure</i>	Secondary structure in dot-bracket notation
<i>verbosity_level</i>	A flag to turn verbose output on/off

## Returns

The free energy of the input structure given the input sequence in kcal/mol

9.25.2.4 float `energy_of_circ_struct_par` ( const char \* *string*, const char \* *structure*, paramT \* *parameters*, int *verbosity\_level* )

Calculate the free energy of an already folded circular RNA.

If verbosity level is set to a value >0, energies of structure elements are printed to stdout

## See also

[energy\\_of\\_struct\\_par\(\)](#), [get\\_scaled\\_parameters\(\)](#)

## Parameters

<i>string</i>	RNA sequence
<i>structure</i>	Secondary structure in dot-bracket notation
<i>parameters</i>	A data structure containing the prescaled energy contributions and the model details.
<i>verbosity_level</i>	A flag to turn verbose output on/off

## Returns

The free energy of the input structure given the input sequence in kcal/mol

9.25.2.5 int `energy_of_structure_pt` ( const char \* *string*, short \* *ptable*, short \* *s*, short \* *s1*, int *verbosity\_level* )

Calculate the free energy of an already folded RNA.

If verbosity level is set to a value >0, energies of structure elements are printed to stdout

## Note

OpenMP: This function relies on several global model settings variables and thus is not to be considered threadsafe. See [energy\\_of\\_struct\\_pt\\_par\(\)](#) for a completely threadsafe implementation.

## See also

[make\\_pair\\_table\(\)](#), [energy\\_of\\_struct\\_pt\\_par\(\)](#)

## Parameters

<i>string</i>	RNA sequence
<i>ptable</i>	the pair table of the secondary structure
<i>s</i>	encoded RNA sequence

<i>s1</i>	encoded RNA sequence
<i>verbosity_level</i>	a flag to turn verbose output on/off

#### Returns

the free energy of the input structure given the input sequence in 10kcal/mol

9.25.2.6 `int energy_of_struct_pt_par ( const char * string, short * ptable, short * s, short * s1, paramT * parameters, int verbosity_level )`

Calculate the free energy of an already folded RNA.

If verbosity level is set to a value >0, energies of structure elements are printed to stdout

#### See also

[make\\_pair\\_table\(\)](#), [energy\\_of\\_struct\\_par\(\)](#), [get\\_scaled\\_parameters\(\)](#)

#### Parameters

<i>string</i>	RNA sequence in uppercase letters
<i>ptable</i>	The pair table of the secondary structure
<i>s</i>	Encoded RNA sequence
<i>s1</i>	Encoded RNA sequence
<i>parameters</i>	A data structure containing the prescaled energy contributions and the model details.
<i>verbosity_level</i>	A flag to turn verbose output on/off

#### Returns

The free energy of the input structure given the input sequence in 10kcal/mol

## 9.26 Searching Sequences for Predefined Structures

Collaboration diagram for Searching Sequences for Predefined Structures:

### Files

- file [inverse.h](#)  
*Inverse folding routines.*

### Functions

- float [inverse\\_fold](#) (char \*start, const char \*target)  
*Find sequences with predefined structure.*
- float [inverse\\_pf\\_fold](#) (char \*start, const char \*target)  
*Find sequence that maximizes probability of a predefined structure.*

### Variables

- char \* [symbolset](#)  
*This global variable points to the allowed bases, initially "AUGC". It can be used to design sequences from reduced alphabets.*
- float [final\\_cost](#)
- int [give\\_up](#)
- int [inv\\_verbose](#)

### 9.26.1 Detailed Description

We provide two functions that search for sequences with a given structure, thereby inverting the folding routines.

### 9.26.2 Function Documentation

#### 9.26.2.1 float [inverse\\_fold](#) ( char \* *start*, const char \* *target* )

Find sequences with predefined structure.

This function searches for a sequence with minimum free energy structure provided in the parameter 'target', starting with sequence 'start'. It returns 0 if the search was successful, otherwise a structure distance in terms of the energy difference between the search result and the actual target 'target' is returned. The found sequence is returned in 'start'. If [give\\_up](#) is set to 1, the function will return as soon as it is clear that the search will be unsuccessful, this speeds up the algorithm if you are only interested in exact solutions.

**Parameters**

<i>start</i>	The start sequence
<i>target</i>	The target secondary structure in dot-bracket notation

**Returns**

The distance to the target in case a search was unsuccessful, 0 otherwise

**9.26.2.2 float inverse\_pf\_fold ( char \* start, const char \* target )**

Find sequence that maximizes probability of a predefined structure.

This function searches for a sequence with maximum probability to fold into the provided structure 'target' using the partition function algorithm. It returns  $-kT \cdot \log(p)$  where  $p$  is the frequency of 'target' in the ensemble of possible structures. This is usually much slower than [inverse\\_fold\(\)](#).

**Parameters**

<i>start</i>	The start sequence
<i>target</i>	The target secondary structure in dot-bracket notation

**Returns**

The distance to the target in case a search was unsuccessful, 0 otherwise

**9.26.3 Variable Documentation****9.26.3.1 float final\_cost**

when to stop [inverse\\_pf\\_fold\(\)](#)

**9.26.3.2 int give\_up**

default 0: try to minimize structure distance even if no exact solution can be found

**9.26.3.3 int inv\_verbose**

print out substructure on which [inverse\\_fold\(\)](#) fails

### 9.27.1 Detailed Description

## 9.28 Distance based partitioning of the Secondary Structure Space

Compute Thermodynamic properties for a Distance Class Partitioning of the Secondary Structure Space.

Collaboration diagram for Distance based partitioning of the Secondary Structure Space:

### Modules

- [Calculating MFE representatives of a Distance Based Partitioning](#)

*Compute the minimum free energy (MFE) and secondary structures for a partitioning of the secondary structure space according to the base pair distance to two fixed reference structures basepair distance to two fixed reference structures.*

- [Calculate Partition Functions of a Distance Based Partitioning](#)

*Compute the partition function and stochastically sample secondary structures for a partitioning of the secondary structure space according to the base pair distance to two fixed reference structures.*

- [Stochastic Backtracking of Structures from Distance Based Partitioning](#)

*Contains functions related to stochastic backtracking from a specified distance class.*

### 9.28.1 Detailed Description

Compute Thermodynamic properties for a Distance Class Partitioning of the Secondary Structure Space.

All functions related to this group implement the basic recursions for MFE folding, partition function computation and stochastic backtracking with a *classified dynamic programming* approach. The secondary structure space is divided into partitions according to the base pair distance to two given reference structures and all relevant properties are calculated for each of the resulting partitions

#### See also

For further details have a look into [\[8\]](#)

## 9.29 Calculating MFE representatives of a Distance Based Partitioning

Compute the minimum free energy (MFE) and secondary structures for a partitioning of the secondary structure space according to the base pair distance to two fixed reference structures basepair distance to two fixed reference structures.

Collaboration diagram for Calculating MFE representatives of a Distance Based Partitioning:

### Files

- file [2Dfold.h](#)

### Functions

- `TwoDfold_vars * get_TwoDfold_variables (const char *seq, const char *structure1, const char *structure2, int circ)`  
*Get a structure of type `TwoDfold_vars` prefilled with current global settings.*
- `void destroy_TwoDfold_variables (TwoDfold_vars *our_variables)`  
*Destroy a `TwoDfold_vars` datastructure without memory loss.*
- `TwoDfold_solution * TwoDfoldList (TwoDfold_vars *vars, int distance1, int distance2)`  
*Compute MFE's and representative for distance partitioning.*
- `char * TwoDfold_backtrack_f5 (unsigned int j, int k, int l, TwoDfold_vars *vars)`  
*Backtrack a minimum free energy structure from a 5' section of specified length.*

#### 9.29.1 Detailed Description

Compute the minimum free energy (MFE) and secondary structures for a partitioning of the secondary structure space according to the base pair distance to two fixed reference structures basepair distance to two fixed reference structures.

#### 9.29.2 Function Documentation

##### 9.29.2.1 `TwoDfold_vars* get_TwoDfold_variables ( const char * seq, const char * structure1, const char * structure2, int circ )`

Get a structure of type `TwoDfold_vars` prefilled with current global settings.

This function returns a datastructure of type `TwoDfold_vars`. The data fields inside the `TwoDfold_vars` are prefilled by global settings and all memory allocations necessary to start a computation are already done for the convenience of the user

**Note**

Make sure that the reference structures are compatible with the sequence according to Watson-Crick- and Wobble-base pairing

**See also**

[destroy\\_TwoDfold\\_variables\(\)](#), [TwoDfold\(\)](#), [TwoDfold\\_circ](#)

**Parameters**

<i>seq</i>	The RNA sequence
<i>structure1</i>	The first reference structure in dot-bracket notation
<i>structure2</i>	The second reference structure in dot-bracket notation
<i>circ</i>	A switch to indicate the assumption to fold a circular instead of linear RNA (0=OFF, 1=ON)

**Returns**

A datastructure prefilled with folding options and allocated memory

### 9.29.2.2 void `destroy_TwoDfold_variables ( TwoDfold_vars * our_variables )`

Destroy a [TwoDfold\\_vars](#) datastructure without memory loss.

This function free's all allocated memory that depends on the datastructure given.

**See also**

[get\\_TwoDfold\\_variables\(\)](#)

**Parameters**

<i>our_variables</i>	A pointer to the datastructure to be destroyed
----------------------	--

### 9.29.2.3 `TwoDfold_solution* TwoDfoldList ( TwoDfold_vars * vars, int distance1, int distance2 )`

Compute MFE's and representative for distance partitioning.

This function computes the minimum free energies and a representative secondary structure for each distance class according to the two references specified in the datastructure 'vars'. The maximum basepair distance to each of both references may be set by the arguments 'distance1' and 'distance2', respectively. If both distance arguments are set to '-1', no restriction is assumed and the calculation is performed for each distance class possible.

The returned list contains an entry for each distance class. If a maximum basepair distance to either of the references was passed, an entry with  $k=-1$  will be appended in the list, denoting the class where all structures exceeding the maximum will be thrown into. The end of the list is denoted by an attribute value of [INF](#) in the k-attribute of the list entry.

**See also**

[get\\_TwoDfold\\_variables\(\)](#), [destroy\\_TwoDfold\\_variables\(\)](#), [TwoDfold\\_solution](#)

**Parameters**

<i>vars</i>	the datastructure containing all predefined folding attributes
<i>distance1</i>	maximum distance to reference1 (-1 means no restriction)
<i>distance2</i>	maximum distance to reference2 (-1 means no restriction)

#### 9.29.2.4 `char* TwoDfold_backtrack_f5 ( unsigned int j, int k, int l, TwoDfold_vars * vars )`

Backtrack a minimum free energy structure from a 5' section of specified length.

This function allows to backtrack a secondary structure beginning at the 5' end, a specified length and residing in a specific distance class. If the argument '*k*' gets a value of -1, the structure that is backtracked is assumed to reside in the distance class where all structures exceeding the maximum basepair distance specified in [TwoDfoldList\(\)](#) belong to.

#### Note

The argument '*vars*' must contain precalculated energy values in the energy matrices, i.e. a call to [TwoDfoldList\(\)](#) preceding this function is mandatory!

#### See also

[TwoDfoldList\(\)](#), [get\\_TwoDfold\\_variables\(\)](#), [destroy\\_TwoDfold\\_variables\(\)](#)

#### Parameters

<i>j</i>	The length in nucleotides beginning from the 5' end
<i>k</i>	distance to reference1 (may be -1)
<i>l</i>	distance to reference2
<i>vars</i>	the datastructure containing all predefined folding attributes

### 9.30 Calculate Partition Functions of a Distance Based Partitioning

Compute the partition function and stochastically sample secondary structures for a partitioning of the secondary structure space according to the base pair distance to two fixed reference structures.

Collaboration diagram for Calculate Partition Functions of a Distance Based Partitioning:

#### Files

- file [2Dpfold.h](#)

#### Functions

- `TwoDpfold_vars * get_TwoDpfold_variables` (const char \*seq, const char \*structure1, char \*structure2, int circ)  
*Get a datastructure containing all necessary attributes and global folding switches.*
- `TwoDpfold_vars * get_TwoDpfold_variables_from_MFE` (TwoDfold\_vars \*mfe\_vars)  
*Get the datastructure containing all necessary attributes and global folding switches from a pre-filled mfe-datastructure.*
- void `destroy_TwoDpfold_variables` (TwoDpfold\_vars \*vars)  
*Free all memory occupied by a TwoDpfold\_vars datastructure.*
- `TwoDpfold_solution * TwoDpfoldList` (TwoDpfold\_vars \*vars, int maxDistance1, int maxDistance2)  
*Compute the partition function for all distance classes.*

#### 9.30.1 Detailed Description

Compute the partition function and stochastically sample secondary structures for a partitioning of the secondary structure space according to the base pair distance to two fixed reference structures.

#### 9.30.2 Function Documentation

##### 9.30.2.1 `TwoDpfold_vars* get_TwoDpfold_variables ( const char * seq, const char * structure1, char * structure2, int circ )`

Get a datastructure containing all necessary attributes and global folding switches.

This function prepares all necessary attributes and matrices etc which are needed for a call of TwoDpfoldList. A snapshot of all current global model switches (dangles, temperature and so on) is done and stored in the returned datastructure. Additionally, all matrices that will hold the partition function values are prepared.

## Parameters

<i>seq</i>	the RNA sequence in uppercase format with letters from the alphabet {AUCG}
<i>structure1</i>	the first reference structure in dot-bracket notation
<i>structure2</i>	the second reference structure in dot-bracket notation
<i>circ</i>	a switch indicating if the sequence is linear (0) or circular (1)

## Returns

the datastructure containing all necessary partition function attributes

9.30.2.2 **TwoDpfold\_vars\*** `get_TwoDpfold_variables_from_MFE ( TwoDfold_vars * mfe_vars )`

Get the datastructure containing all necessary attributes and global folding switches from a pre-filled mfe-datastructure.

This function actually does the same as `get_TwoDpfold_variables` but takes its switches and settings from a pre-filled MFE equivalent datastructure

## See also

[get\\_TwoDfold\\_variables\(\)](#), [get\\_TwoDpfold\\_variables\(\)](#)

## Parameters

<i>mfe_vars</i>	the pre-filled mfe datastructure
-----------------	----------------------------------

## Returns

the datastructure containing all necessary partition function attributes

9.30.2.3 **void** `destroy_TwoDpfold_variables ( TwoDpfold_vars * vars )`

Free all memory occupied by a [TwoDpfold\\_vars](#) datastructure.

This function free's all memory occupied by a datastructure obtained from from [get\\_TwoDpfold\\_variables\(\)](#) or [get\\_TwoDpfold\\_variables\\_from\\_MFE\(\)](#)

## See also

[get\\_TwoDpfold\\_variables\(\)](#), [get\\_TwoDpfold\\_variables\\_from\\_MFE\(\)](#)

## Parameters

<i>vars</i>	the datastructure to be free'd
-------------	--------------------------------

9.30.2.4 **TwoDpfold\_solution\*** `TwoDpfoldList ( TwoDpfold_vars * vars, int maxDistance1, int maxDistance2 )`

Compute the partition function for all distance classes.

This function computes the partition functions for all distance classes according the two reference structures specified in the datastructure 'vars'. Similar to [TwoDfoldList\(\)](#) the arguments `maxDistance1` and `maxDistance2` specify the maximum distance to both reference structures. A value of '-1' in either of them makes the appropriate distance restrictionless, i.e. all basepair distances to the reference are taken into account during computation. In case there is a restriction, the returned solution contains an entry where the attribute `k=-1` contains the partition function for all structures exceeding the restriction. A values of [INF](#) in the attribute 'k' of the returned list denotes the end of the list

See also

[get\\_TwoDpfold\\_variables\(\)](#), [destroy\\_TwoDpfold\\_variables\(\)](#), [TwoDpfold\\_solution](#)

Parameters

<i>vars</i>	the datastructure containing all necessary folding attributes and matrices
<i>maxDistance1</i>	the maximum basepair distance to reference1 (may be -1)
<i>maxDistance2</i>	the maximum basepair distance to reference2 (may be -1)

Returns

a list of partition funtions for the appropriate distance classes

## 9.31 Stochastic Backtracking of Structures from Distance Based Partitioning

Contains functions related to stochastic backtracking from a specified distance class.

Collaboration diagram for Stochastic Backtracking of Structures from Distance Based Partitioning:

### Functions

- `char * TwoDpfold_pbacktrack (TwoDpfold_vars *vars, int d1, int d2)`  
*Sample secondary structure representatives from a set of distance classes according to their Boltzmann probability.*
- `char * TwoDpfold_pbacktrack5 (TwoDpfold_vars *vars, int d1, int d2, unsigned int length)`  
*Sample secondary structure representatives with a specified length from a set of distance classes according to their Boltzmann probability.*

### 9.31.1 Detailed Description

Contains functions related to stochastic backtracking from a specified distance class.

### 9.31.2 Function Documentation

#### 9.31.2.1 `char* TwoDpfold_pbacktrack ( TwoDpfold_vars * vars, int d1, int d2 )`

Sample secondary structure representatives from a set of distance classes according to their Boltzmann probability.

If the argument 'd1' is set to '-1', the structure will be backtracked in the distance class where all structures exceeding the maximum basepair distance to either of the references reside.

#### Precondition

The argument 'vars' must contain precalculated partition function matrices, i.e. a call to [TwoDpfoldList\(\)](#) preceding this function is mandatory!

#### See also

[TwoDpfoldList\(\)](#)

#### Parameters

in	<i>vars</i>	the datastructure containing all necessary folding attributes and matrices
in	<i>d1</i>	the distance to reference1 (may be -1)
in	<i>d2</i>	the distance to reference2

**Returns**

A sampled secondary structure in dot-bracket notation

**9.31.2.2 char\* TwoDpfold\_pbacktrack5 ( TwoDpfold\_vars \* vars, int d1, int d2, unsigned int length )**

Sample secondary structure representatives with a specified length from a set of distance classes according to their Boltzmann probability.

This function does essentially the same as TwoDpfold\_pbacktrack with the only difference that partial structures, i.e. structures beginning from the 5' end with a specified length of the sequence, are backtracked

**Note**

This function does not work (since it makes no sense) for circular RNA sequences!

**Precondition**

The argument 'vars' must contain precalculated partition function matrices, i.e. a call to [TwoDpfoldList\(\)](#) preceding this function is mandatory!

**See also**

[TwoDpfold\\_pbacktrack\(\)](#), [TwoDpfoldList\(\)](#)

**Parameters**

in	<i>vars</i>	the datastructure containing all necessary folding attributes and matrices
in	<i>d1</i>	the distance to reference1 (may be -1)
in	<i>d2</i>	the distance to reference2
in	<i>length</i>	the length of the structure beginning from the 5' end

**Returns**

A sampled secondary structure in dot-bracket notation

## 9.32 Compute the Density of States

## 10.18 PAIR Struct Reference

Base pair data structure used in subopt.c.

### 10.18.1 Detailed Description

Base pair data structure used in subopt.c.

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.19 pair\_info Struct Reference

A base pair info structure.

### Data Fields

- unsigned `i`  
*nucleotide position  $i$*
- unsigned `j`  
*nucleotide position  $j$*
- float `p`  
*Probability.*
- float `ent`  
*Pseudo entropy for  $p(i, j) = S_i + S_j - p_{ij} * \ln(p_{ij})$ .*
- short `bp` [8]  
*Frequencies of pair\_types.*
- char `comp`  
*1 iff pair is in mfe structure*

### 10.19.1 Detailed Description

A base pair info structure.

For each base pair (i,j) with i,j in [0, n-1] the structure lists:

- its probability 'p'
- an entropy-like measure for its well-definedness 'ent'
- the frequency of each type of pair in 'bp[]'
  - 'bp[0]' contains the number of non-compatible sequences
  - 'bp[1]' the number of CG pairs, etc.

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.20 pairpro Struct Reference

Collaboration diagram for pairpro:

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](/home/mescal/ronny/WORK/ViennaRNA/H/data_structures.h)

## 10.21 paramT Struct Reference

The datastructure that contains temperature scaled energy parameters.

Collaboration diagram for paramT:

### Data Fields

- [model\\_detailsT model\\_details](#)

*Model details to be used in the recursions.*

### 10.21.1 Detailed Description

The datastructure that contains temperature scaled energy parameters.

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/data\\_structures.h](/home/mescalini/ronny/WORK/ViennaRNA/H/data_structures.h)

## 10.22 path\_t Struct Reference

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/data\\_structures.h](/home/mescalini/ronny/WORK/ViennaRNA/H/data_structures.h)

## 10.23 pf\_paramT Struct Reference

The datastructure that contains temperature scaled Boltzmann weights of the energy parameters.

Collaboration diagram for pf\_paramT:

### Data Fields

- double [pf\\_scale](#)  
*Scaling factor to avoid over-/underflows.*
- double [temperature](#)  
*Temperature used for loop contribution scaling.*
- double [alpha](#)  
*Scaling factor for the thermodynamic temperature.*
- [model\\_detailsT](#) [model\\_details](#)  
*Model details to be used in the recursions.*

### 10.23.1 Detailed Description

The datastructure that contains temperature scaled Boltzmann weights of the energy parameters.

## 10.23.2 Field Documentation

### 10.23.2.1 double pf\_paramT::alpha

Scaling factor for the thermodynamic temperature.

This allows for temperature scaling in Boltzmann factors independently from the energy contributions. The resulting Boltzmann factors are then computed by  $e^{-E/(\alpha \cdot K \cdot T)}$

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.24 plist Struct Reference

this datastructure is used as input parameter in functions of [PS\\_dot.h](#) and others

### 10.24.1 Detailed Description

this datastructure is used as input parameter in functions of [PS\\_dot.h](#) and others

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.25 Postorder\_list Struct Reference

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/dist\\_vars.h](#)

## 10.26 pu\_contrib Struct Reference

contributions to p\_u

### Data Fields

- double \*\* [H](#)  
*hairpin loops*
- double \*\* [I](#)  
*interior loops*
- double \*\* [M](#)  
*multi loops*
- double \*\* [E](#)  
*exterior loop*
- int [length](#)  
*length of the input sequence*
- int [w](#)  
*longest unpaired region*

### 10.26.1 Detailed Description

contributions to p\_u

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.27 pu\_out Struct Reference

Collection of all free\_energy of beeing unpaired values for output.

### Data Fields

- int [len](#)  
*sequence length*
- int [u\\_vals](#)  
*number of different -u values*
- int [contribs](#)  
*[-c "SHIME"]*
- char \*\* [header](#)  
*header line*
- double \*\* [u\\_values](#)  
*(the -u values \* [-c "SHIME"]) \* seq len*

### 10.27.1 Detailed Description

Collection of all free\_energy of beeing unpaired values for output.

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.28 sect Struct Reference

Stack of partial structures for backtracking.

### 10.28.1 Detailed Description

Stack of partial structures for backtracking.

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.29 snoopT Struct Reference

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.30 SOLUTION Struct Reference

Solution element from subopt.c.

### Data Fields

- float [energy](#)

*Free Energy of structure in kcal/mol.*

- char \* [structure](#)

*Structure in dot-bracket notation.*

### 10.30.1 Detailed Description

Solution element from subopt.c.

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.31 struct\_en Struct Reference

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/move\\_set.h](#)

## 10.32 svm\_model Struct Reference

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/svm\\_utils.h](#)

## 10.33 swString Struct Reference

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/dist\\_vars.h](#)

## 10.34 Tree Struct Reference

Collaboration diagram for Tree:

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/dist\\_vars.h](#)

## 10.35 TwoDfold\_solution Struct Reference

Solution element returned from TwoDfoldList.

### Data Fields

- int [k](#)  
*Distance to first reference.*
- int [l](#)  
*Distance to second reference.*
- float [en](#)  
*Free energy in kcal/mol.*
- char \* [s](#)  
*MFE representative structure in dot-bracket notation.*

### 10.35.1 Detailed Description

Solution element returned from TwoDfoldList.

This element contains free energy and structure for the appropriate kappa (k), lambda (l) neighborhood. The data-structure contains two integer attributes 'k' and 'l' as well as an attribute 'en' of type float representing the free energy in kcal/mol and an attribute 's' of type char\* containing the secondary structure representative,

A value of [INF](#) in k denotes the end of a list.

See also

[TwoDfoldList\(\)](#)

The documentation for this struct was generated from the following file:

- [/home/mescalini/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.36 TwoDfold\_vars Struct Reference

Variables compound for 2Dfold MFE folding.

Collaboration diagram for TwoDfold\_vars:

### Data Fields

- `paramT * P`  
*Precomputed energy parameters and model details.*
- `int do_backtrack`  
*Flag whether to do backtracing of the structure(s) or not.*
- `char * ptype`  
*Precomputed array of pair types.*
- `char * sequence`  
*The input sequence.*
- `short * S1`  
*The input sequences in numeric form.*
- `unsigned int maxD1`  
*Maximum allowed base pair distance to first reference.*
- `unsigned int maxD2`  
*Maximum allowed base pair distance to second reference.*
- `unsigned int * mm1`  
*Maximum matching matrix, reference struct 1 disallowed.*
- `unsigned int * mm2`  
*Maximum matching matrix, reference struct 2 disallowed.*
- `int * my_iindx`  
*Index for moving in quadratic distancy dimensions.*
- `unsigned int * referenceBPs1`  
*Matrix containing number of basepairs of reference structure1 in interval [i,j].*
- `unsigned int * referenceBPs2`  
*Matrix containing number of basepairs of reference structure2 in interval [i,j].*
- `unsigned int * bpdist`  
*Matrix containing base pair distance of reference structure 1 and 2 on interval [i,j].*

### 10.36.1 Detailed Description

Variables compound for 2Dfold MFE folding.

See also

[get\\_TwoDfold\\_variables\(\)](#), [destroy\\_TwoDfold\\_variables\(\)](#), [TwoDfoldList\(\)](#)

The documentation for this struct was generated from the following file:

- [/home/mescal/ronny/WORK/ViennaRNA/H/data\\_structures.h](#)

## 10.37 TwoDpfold\_solution Struct Reference

Solution element returned from TwoDpfoldList.

### Data Fields

- int [k](#)  
*Distance to first reference.*
- int [l](#)  
*Distance to second reference.*
- double [q](#)  
*partition function*

### 10.37.1 Detailed Description

Solution element returned from TwoDpfoldList.

This element contains the partition function for the appropriate kappa (k), lambda (l) neighborhood The datastructure contains two integer attributes 'k' and 'l' as well as an attribute 'q' of type #FLT\_OR\_DBL

A value of [INF](#) in k denotes the end of a list

See also

[TwoDpfoldList\(\)](#)

The documentation for this struct was generated from the following file:

## 10.38 TwoDpfold\_vars Struct Reference

Variables compound for 2Dfold partition function folding.

Collaboration diagram for TwoDpfold\_vars:

## Data Fields

- char \* [ptype](#)  
*Precomputed array of pair types.*
- char \* [sequence](#)  
*The input sequence.*
- short \* [S1](#)  
*The input sequences in numeric form.*
- unsigned int [maxD1](#)  
*Maximum allowed base pair distance to first reference.*
- unsigned int [maxD2](#)  
*Maximum allowed base pair distance to second reference.*
- int \* [my\\_iindx](#)  
*Index for moving in quadratic distance dimensions.*
- int \* [jindx](#)  
*Index for moving in the triangular matrix qm1.*
- unsigned int \* [referenceBPs1](#)  
*Matrix containing number of basepairs of reference structure1 in interval [i,j].*
- unsigned int \* [referenceBPs2](#)  
*Matrix containing number of basepairs of reference structure2 in interval [i,j].*
- unsigned int \* [bpdist](#)  
*Matrix containing base pair distance of reference structure 1 and 2 on interval [i,j].*
- unsigned int \* [mm1](#)  
*Maximum matching matrix, reference struct 1 disallowed.*
- unsigned int \* [mm2](#)  
*Maximum matching matrix, reference struct 2 disallowed.*

### 10.38.1 Detailed Description

Variables compound for 2Dfold partition function folding.

See also

[get\\_TwoDpfold\\_variables\(\)](#), [get\\_TwoDpfold\\_variables\\_from\\_MFE\(\)](#), [destroy\\_TwoDpfold\\_variables\(\)](#), [TwoDpfoldList\(\)](#)

The documentation for this struct was generated from the following file:

## Chapter 11

# File Documentation

### 11.1 /home/mescal/ronny/WORK/ViennaRNA/H/2Dfold.h File Reference

Include dependency graph for 2Dfold.h:

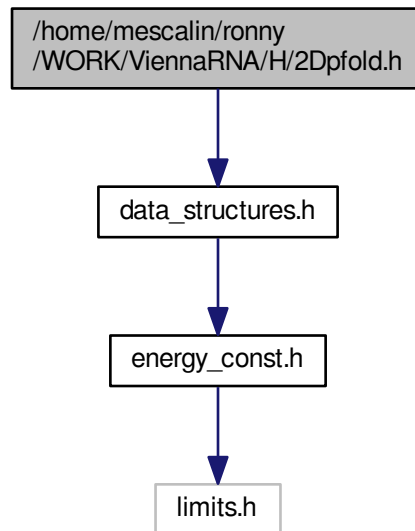

### Functions

- `TwoDfold_vars * get_TwoDfold_variables` (const char \*seq, const char \*structure1, const char \*structure2, int circ)  
*Get a structure of type `TwoDfold_vars` prefilled with current global settings.*
- void `destroy_TwoDfold_variables` (`TwoDfold_vars` \*our\_variables)  
*Destroy a `TwoDfold_vars` datastructure without memory loss.*
- `TwoDfold_solution * TwoDfoldList` (`TwoDfold_vars` \*vars, int distance1, int distance2)  
*Compute MFE's and representative for distance partitioning.*
- char \* `TwoDfold_backtrack_f5` (unsigned int j, int k, int l, `TwoDfold_vars` \*vars)  
*Backtrack a minimum free energy structure from a 5' section of specified length.*

## 11.2 /home/mescaline/ronny/WORK/ViennaRNA/H/2Dpfold.h File Reference

Include dependency graph for 2Dpfold.h:

### Functions

- `TwoDpfold_vars * get_TwoDpfold_variables` (const char \*seq, const char \*structure1, char \*structure2, int circ)  
*Get a datastructure containing all necessary attributes and global folding switches.*
- `TwoDpfold_vars * get_TwoDpfold_variables_from_MFE` (TwoDpfold\_vars \*mfe\_vars)  
*Get the datastructure containing all necessary attributes and global folding switches from a pre-filled mfe-datastructure.*
- void `destroy_TwoDpfold_variables` (TwoDpfold\_vars \*vars)  
*Free all memory occupied by a TwoDpfold\_vars datastructure.*
- `TwoDpfold_solution * TwoDpfoldList` (TwoDpfold\_vars \*vars, int maxDistance1, int maxDistance2)  
*Compute the partition function for all distance classes.*
- char \* `TwoDpfold_pbacktrack` (TwoDpfold\_vars \*vars, int d1, int d2)  
*Sample secondary structure representatives from a set of distance classes according to their Boltzmann probability.*
- char \* `TwoDpfold_pbacktrack5` (TwoDpfold\_vars \*vars, int d1, int d2, unsigned int length)  
*Sample secondary structure representatives with a specified length from a set of distance classes according to their Boltzmann probability.*

## 11.3 /home/mescaline/ronny/WORK/ViennaRNA/H/alifold.h File Reference

compute various properties (consensus MFE structures, partition function, Boltzmann distributed stochastic samples, ...) for RNA sequence alignments

Include dependency graph for alifold.h:

## Functions

- void [update\\_alifold\\_params](#) (void)  
*Update the energy parameters for alifold function.*
- float [alifold](#) (const char \*\*strings, char \*structure)  
*Compute MFE and according consensus structure of an alignment of sequences.*
- float [circalifold](#) (const char \*\*strings, char \*structure)  
*Compute MFE and according structure of an alignment of sequences assuming the sequences are circular instead of linear.*
- void [free\\_alifold\\_arrays](#) (void)  
*Free the memory occupied by MFE alifold functions.*
- int [get\\_mpi](#) (char \*Alseq[], int n\_seq, int length, int \*mini)  
*Get the mean pairwise identity in steps from ?to?(ident)*
- float \*\* [readribosum](#) (char \*name)  
*Read a ribosum or other user-defined scoring matrix.*
- float [energy\\_of\\_alistruct](#) (const char \*\*sequences, const char \*structure, int n\_seq, float \*energy)  
*Calculate the free energy of a consensus structure given a set of aligned sequences.*
- void [encode\\_ali\\_sequence](#) (const char \*sequence, short \*S, short \*s5, short \*s3, char \*ss, unsigned short \*as, int circ)  
*Get arrays with encoded sequence of the alignment.*
- void [alloc\\_sequence\\_arrays](#) (const char \*\*sequences, short \*\*\*S, short \*\*\*S5, short \*\*\*S3, unsigned short \*\*\*a2s, char \*\*\*Ss, int circ)  
*Allocate memory for sequence array used to deal with aligned sequences.*
- void [free\\_sequence\\_arrays](#) (unsigned int n\_seq, short \*\*\*S, short \*\*\*S5, short \*\*\*S3, unsigned short \*\*\*a2s, char \*\*\*Ss)  
*Free the memory of the sequence arrays used to deal with aligned sequences.*

- float [alipf\\_fold\\_par](#) (const char \*\*sequences, char \*structure, [plist](#) \*\*pl, [pf\\_paramT](#) \*parameters, int calculate\_bppm, int is\_constrained, int is\_circular)
- float [alipf\\_fold](#) (const char \*\*sequences, char \*structure, [plist](#) \*\*pl)

*The partition function version of [alifold\(\)](#) works in analogy to [pf\\_fold\(\)](#). Pair probabilities and information about sequence covariations are returned via the 'pi' variable as a list of [pair\\_info](#) structs. The list is terminated by the first entry with  $pi.i = 0$ .*

- float [alipf\\_circ\\_fold](#) (const char \*\*sequences, char \*structure, [plist](#) \*\*pl)
- double \* [export\\_ali\\_bppm](#) (void)

*Get a pointer to the base pair probability array.*

- char \* [alipbacktrack](#) (double \*prob)

*Sample a consensus secondary structure from the Boltzmann ensemble according its probability*

- int [get\\_alipf\\_arrays](#) (short \*\*\*S\_p, short \*\*\*S5\_p, short \*\*\*S3\_p, unsigned short \*\*\*a2s\_p, char \*\*\*Ss\_p, double \*\*qb\_p, double \*\*qm\_p, double \*\*q1k\_p, double \*\*qln\_p, short \*\*pscore)

*Get pointers to (almost) all relevant arrays used in alifold's partition function computation.*

## Variables

- double [cv\\_fact](#)

*This variable controls the weight of the covariance term in the energy function of alignment folding algorithms.*

- double [nc\\_fact](#)

*This variable controls the magnitude of the penalty for non-compatible sequences in the covariance term of alignment folding algorithms.*

### 11.3.1 Detailed Description

compute various properties (consensus MFE structures, partition function, Boltzmann distributed stochastic samples, ...) for RNA sequence alignments

### 11.3.2 Function Documentation

#### 11.3.2.1 void update\_alifold\_params ( void )

Update the energy parameters for alifold function.

Call this to recalculate the pair matrix and energy parameters after a change in folding parameters like [temperature](#)

## 11.4 /home/mescalini/ronny/WORK/ViennaRNA/H/cofold.h File Reference

MFE version of cofolding routines.

Include dependency graph for cofold.h:

## Functions

- float [cofold](#) (const char \*sequence, char \*structure)  
*Compute the minimum free energy of two interacting RNA molecules.*
- float [cofold\\_par](#) (const char \*string, char \*structure, [paramT](#) \*parameters, int is\_constrained)  
*Compute the minimum free energy of two interacting RNA molecules.*
- void [free\\_co\\_arrays](#) (void)  
*Free memory occupied by [cofold\(\)](#)*
- void [update\\_cofold\\_params](#) (void)  
*Recalculate parameters.*
- void [export\\_cofold\\_arrays\\_gq](#) (int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*fc\_p, int \*\*ggg\_p, int \*\*indx\_p, char \*\*ptype\_p)  
*Export the arrays of partition function cofold (with gquadruplex support)*
- void [export\\_cofold\\_arrays](#) (int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*fc\_p, int \*\*indx\_p, char \*\*ptype\_p)  
*Export the arrays of partition function cofold.*
- [SOLUTION](#) \* [zukersubopt](#) (const char \*string)  
*Compute Zuker type suboptimal structures.*
- [SOLUTION](#) \* [zukersubopt\\_par](#) (const char \*string, [paramT](#) \*parameters)  
*Compute Zuker type suboptimal structures.*
- void [get\\_monomere\\_mfes](#) (float \*e1, float \*e2)  
*get\_monomer\_free\_energies*
- void [initialize\\_cofold](#) (int length)

### 11.4.1 Detailed Description

MFE version of cofolding routines.

This file includes (almost) all function declarations within the **RNAlib** that are related to MFE Cofolding... This also includes the Zuker suboptimals calculations, since they are implemented using the cofold routines.

### 11.4.2 Function Documentation

#### 11.4.2.1 void get\_monomere\_mfes ( float \* *e1*, float \* *e2* )

get\_monomer\_free\_energies

Export monomer free energies out of cofold arrays

Parameters

<i>e1</i>	A pointer to a variable where the energy of molecule A will be written to
<i>e2</i>	A pointer to a variable where the energy of molecule B will be written to

#### 11.4.2.2 void initialize\_cofold ( int *length* )

allocate arrays for folding

**Deprecated** {This function is obsolete and will be removed soon!}

## 11.5 /home/mescalini/ronny/WORK/ViennaRNA/H/convert\_epars.h File Reference

Functions and definitions for energy parameter file format conversion.

### Macros

- #define [VRNA\\_CONVERT\\_OUTPUT\\_ALL](#) 1U

### 11.6.1 Detailed Description

All datastructures and typedefs shared among the Vienna RNA Package can be found here.

## 11.7 /home/mescal/ronny/WORK/ViennaRNA/H/dist\_vars.h File Reference

Global variables for Distance-Package.

This graph shows which files directly or indirectly include this file:

### Data Structures

- struct [Postorder\\_list](#)
- struct [Tree](#)
- struct [swString](#)

### Variables

- int [edit\\_backtrack](#)  
*Produce an alignment of the two structures being compared by tracing the editing path giving the minimum distance.*
- char \* [aligned\\_line](#) [4]  
*Contains the two aligned structures after a call to one of the distance functions with [edit\\_backtrack](#) set to 1.*
- int [cost\\_matrix](#)  
*Specify the cost matrix to be used for distance calculations.*

#### 11.7.1 Detailed Description

Global variables for Distance-Package.

#### 11.7.2 Variable Documentation

##### 11.7.2.1 int edit\_backtrack

Produce an alignment of the two structures being compared by tracing the editing path giving the minimum distance.  
set to 1 if you want backtracking

##### 11.7.2.2 int cost\_matrix

Specify the cost matrix to be used for distance calculations.

if 0, use the default cost matrix (upper matrix in example), otherwise use Shapiro's costs (lower matrix).

energy constants

### 11.10.2 Macro Definition Documentation

#### 11.10.2.1 `#define GASCONST 1.98717 /* in [cal/K] */`

The gas constant

#### 11.10.2.2 `#define K0 273.15`

0 deg Celsius in Kelvin

11.10.2.3 `#define INF 10000000 /* (INT_MAX/10) */`

Infinity as used in minimization routines

11.10.2.4 `#define FORBIDDEN 9999`

forbidden

11.10.2.5 `#define BONUS 10000`

bonus contribution

11.10.2.6 `#define NBPAIRS 7`

The number of distinguishable base pairs

11.10.2.7 `#define TURN 3`

The minimum loop length

11.10.2.8 `#define MAXLOOP 30`

The maximum loop length

11.10.2.9 `#define NBPAIRS_HYBRID 32`

The number of base pairs for the hybrid case

11.10.2.10 `#define NNUCLEOTIDES_HYBRID 16`

The number of distinguishable nucleotides in the hybrid case

## 11.11 `/home/mescal/ronny/WORK/ViennaRNA/H/findpath.h` File Reference

Compute direct refolding paths between two secondary structures.

Include dependency graph for findpath.h:

## Functions

- int [find\\_saddle](#) (const char \*seq, const char \*struc1, const char \*struc2, int max)  
*Find energy of a saddle point between 2 structures (serch only direct path)*
- [path\\_t](#) \* [get\\_path](#) (const char \*seq, const char \*s1, const char \*s2, int maxkeep)  
*Find refolding path between 2 structures (serch only direct path)*
- void [free\\_path](#) ([path\\_t](#) \*path)  
*Free memory allocated by [get\\_path\(\)](#) function.*

### 11.11.1 Detailed Description

Compute direct refolding paths between two secondary structures.

### 11.11.2 Function Documentation

11.11.2.1 int [find\\_saddle](#) ( const char \* *seq*, const char \* *struc1*, const char \* *struc2*, int *max* )

Find energy of a saddle point between 2 structures (serch only direct path)

Parameters

<i>seq</i>	RNA sequence
<i>struc1</i>	A pointer to the character array where the first secondary structure in dot-bracket notation will be written to

<i>struc2</i>	A pointer to the character array where the second secondary structure in dot-bracket notation will be written to
<i>max</i>	integer how many strutures are being kept during the search

**Returns**

the saddle energy in 10cal/mol

### 11.11.2.2 `path_t* get_path ( const char * seq, const char * s1, const char * s2, int maxkeep )`

Find refolding path between 2 structures (serch only direct path)

**Parameters**

<i>seq</i>	RNA sequence
<i>s1</i>	A pointer to the character array where the first secondary structure in dot-bracket notation will be written to
<i>s2</i>	A pointer to the character array where the second secondary structure in dot-bracket notation will be written to
<i>maxkeep</i>	integer how many strutures are being kept during the search

**Returns**

direct refolding path between two structures

### 11.11.2.3 `void free_path ( path_t * path )`

Free memory allocated by [get\\_path\(\)](#) function.

**Parameters**

<i>path</i>	pointer to memory to be freed
-------------	-------------------------------

## 11.12 /home/mescalini/ronny/WORK/ViennaRNA/H/fold.h File Reference

MFE calculations and energy evaluations for single RNA sequences.

Include dependency graph for fold.h:

### 11.12.1 Detailed Description

MFE calculations and energy evaluations for single RNA sequences.

This file includes (almost) all function declarations within the RNAlib that are related to MFE folding...

### 11.12.2 Function Documentation

#### 11.12.2.1 void parenthesis\_structure ( char \* *structure*, [bondT](#) \* *bp*, int *length* )

Create a dot-bracket/parenthesis structure from backtracking stack.

#### Note

This function is threadsafe

### 11.12.2.2 void parenthesis\_zuker ( char \* *structure*, bondT \* *bp*, int *length* )

Create a dot-bracket/parenthesis structure from backtracking stack obtained by zucker suboptimal calculation in cofold.c.

#### Note

This function is threadsafe

### 11.12.2.3 float energy\_of\_move ( const char \* *string*, const char \* *structure*, int *m1*, int *m2* )

Calculate energy of a move (closing or opening of a base pair)

If the parameters *m1* and *m2* are negative, it is deletion (opening) of a base pair, otherwise it is insertion (opening).

#### See also

[make\\_pair\\_table\(\)](#), [energy\\_of\\_move\(\)](#)

#### Parameters

<i>string</i>	RNA sequence
<i>structure</i>	secondary structure in dot-bracket notation
<i>m1</i>	first coordinate of base pair
<i>m2</i>	second coordinate of base pair

#### Returns

energy change of the move in kcal/mol

### 11.12.2.4 int energy\_of\_move\_pt ( short \* *pt*, short \* *s*, short \* *s1*, int *m1*, int *m2* )

Calculate energy of a move (closing or opening of a base pair)

If the parameters *m1* and *m2* are negative, it is deletion (opening) of a base pair, otherwise it is insertion (opening).

#### See also

[make\\_pair\\_table\(\)](#), [energy\\_of\\_move\(\)](#)

#### Parameters

<i>pt</i>	the pair table of the secondary structure
<i>s</i>	encoded RNA sequence
<i>s1</i>	encoded RNA sequence
<i>m1</i>	first coordinate of base pair
<i>m2</i>	second coordinate of base pair

#### Returns

energy change of the move in 10cal/mol

### 11.12.2.5 int loop\_energy ( short \* *ptable*, short \* *s*, short \* *s1*, int *i* )

Calculate energy of a loop.

## Parameters

<i>ptable</i>	the pair table of the secondary structure
<i>s</i>	encoded RNA sequence
<i>s1</i>	encoded RNA sequence
<i>i</i>	position of covering base pair

## Returns

free energy of the loop in 10cal/mol

11.12.2.6 void assign\_plist\_from\_db ( plist \*\* *pl*, const char \* *struc*, float *pr* )

Create a plist from a dot-bracket string.

The dot-bracket string is parsed and for each base pair an entry in the plist is created. The probability of each pair in the list is set by a function parameter.

The end of the plist is marked by sequence positions *i* as well as *j* equal to 0. This condition should be used to stop looping over its entries

This function is threadsafe

## Parameters

<i>pl</i>	A pointer to the plist that is to be created
<i>struc</i>	The secondary structure in dot-bracket notation
<i>pr</i>	The probability for each base pair

11.12.2.7 int LoopEnergy ( int *n1*, int *n2*, int *type*, int *type\_2*, int *si1*, int *sj1*, int *sp1*, int *sq1* )

**Deprecated** {This function is deprecated and will be removed soon. Use [E\\_IntLoop\(\)](#) instead!}

11.12.2.8 int HairpinE ( int *size*, int *type*, int *si1*, int *sj1*, const char \* *string* )

**Deprecated** {This function is deprecated and will be removed soon. Use [E\\_Hairpin\(\)](#) instead!}

11.12.2.9 void initialize\_fold ( int *length* )

Allocate arrays for folding

**Deprecated** {This function is deprecated and will be removed soon!}

11.12.2.10 float energy\_of\_struct ( const char \* *string*, const char \* *structure* )

Calculate the free energy of an already folded RNA

## Note

This function is not entirely threadsafe! Depending on the state of the global variable [eos\\_debug](#) it prints energy information to stdout or not...

**Deprecated** This function is deprecated and should not be used in future programs! Use [energy\\_of\\_structure\(\)](#) instead!

See also

[energy\\_of\\_structure](#), [energy\\_of\\_circ\\_struct\(\)](#), [energy\\_of\\_struct\\_pt\(\)](#)

Parameters

<i>string</i>	RNA sequence
<i>structure</i>	secondary structure in dot-bracket notation

Returns

the free energy of the input structure given the input sequence in kcal/mol

11.12.2.11 `int energy_of_struct_pt ( const char * string, short * ptable, short * s, short * s1 )`

Calculate the free energy of an already folded RNA

Note

This function is not entirely threadsafe! Depending on the state of the global variable [eos\\_debug](#) it prints energy information to stdout or not...

**Deprecated** This function is deprecated and should not be used in future programs! Use [energy\\_of\\_structure\\_pt\(\)](#) instead!

See also

[make\\_pair\\_table\(\)](#), [energy\\_of\\_structure\(\)](#)

Parameters

<i>string</i>	RNA sequence
<i>ptable</i>	the pair table of the secondary structure
<i>s</i>	encoded RNA sequence
<i>s1</i>	encoded RNA sequence

Returns

the free energy of the input structure given the input sequence in 10kcal/mol

11.12.2.12 `float energy_of_circ_struct ( const char * string, const char * structure )`

Calculate the free energy of an already folded circular RNA

Note

This function is not entirely threadsafe! Depending on the state of the global variable [eos\\_debug](#) it prints energy information to stdout or not...

**Deprecated** This function is deprecated and should not be used in future programs Use [energy\\_of\\_circ\\_structure\(\)](#) instead!

See also

[energy\\_of\\_circ\\_structure\(\)](#), [energy\\_of\\_struct\(\)](#), [energy\\_of\\_struct\\_pt\(\)](#)

## Parameters

<i>string</i>	RNA sequence
<i>structure</i>	secondary structure in dot-bracket notation

## Returns

the free energy of the input structure given the input sequence in kcal/mol

### 11.13 /home/mescalini/ronny/WORK/ViennaRNA/H/fold\_vars.h File Reference

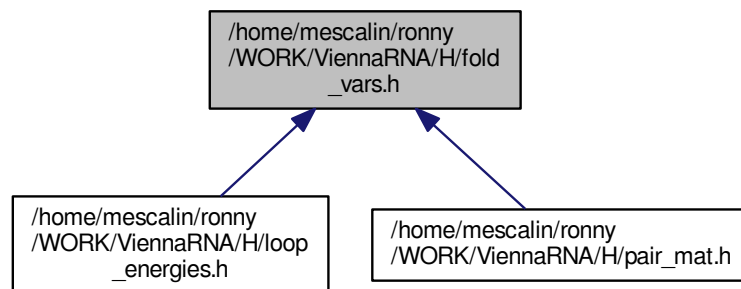

Here all all declarations of the global variables used throughout RNAlib.

Include dependency graph for fold\_vars.h:

This graph shows which files directly or indirectly include this file:

## Functions

- void `set_model_details` (`model_detailsT *md`)  
*Set default model details.*

## Variables

- int `fold_constrained`  
*Global switch to activate/deactivate folding with structure constraints.*
- int `noLonelyPairs`  
*Global switch to avoid/allow helices of length 1.*
- int `dangles`  
*Switch the energy model for dangling end contributions (0, 1, 2, 3)*
- int `noGU`  
*Global switch to forbid/allow GU base pairs at all.*
- int `no_closingGU`  
*GU allowed only inside stacks if set to 1.*
- int `tetra_loop`  
*Include special stabilizing energies for some tri-, tetra- and hexa-loops;.*
- int `energy_set`  
*0 = BP; 1=any mit GC; 2=any mit AU-parameter*
- int `circ`  
*backward compatibility variable.. this does not effect anything*
- int `csv`  
*generate comma seperated output*
- int `oldAliEn`
- int `ribo`

- char \* `nonstandards`  
*contains allowed non standard base pairs*
- double `temperature`  
*Rescale energy parameters to a temperature in degC.*
- int `james_rule`
- int `logML`

- int `cut_point`  
*Marks the position (starting from 1) of the first nucleotide of the second molecule within the concatenated sequence.*
- `bondT * base_pair`  
*Contains a list of base pairs after a call to `fold()`.*
- double \* `pr`  
*A pointer to the base pair probability matrix.*
- int \* `iindx`  
*index array to move through `pr`.*
- double `pf_scale`  
*A scaling factor used by `pf_fold()` to avoid overflows.*
- int `do_backtrack`  
*do backtracking, i.e. compute secondary structures or base pair probabilities*
- char `backtrack_type`  
*A backtrack array marker for `inverse_fold()`*
- int `gquad`  
*Allow G-quadruplex formation.*
- int `canonicalBPonly`

### 11.13.1 Detailed Description

Here all all declarations of the global variables used throughout RNAlib.

### 11.13.2 Function Documentation

#### 11.13.2.1 void set\_model\_details ( model\_detailsT \* md )

Set default model details.

Use this function if you wish to initialize a `model_detailsT` data structure with its default values, i.e. the global model settings

See also

#### Parameters

<i>md</i>	A pointer to the data structure that shall be initialized
-----------	---

### 11.13.3 Variable Documentation

#### 11.13.3.1 int noLonelyPairs

Global switch to avoid/allow helices of length 1.

Disallow all pairs which can only occur as lonely pairs (i.e. as helix of length 1). This avoids lonely base pairs in the predicted structures in most cases.

#### 11.13.3.2 int dangles

Switch the energy model for dangling end contributions (0, 1, 2, 3)

If set to 0 no stabilizing energies are assigned to bases adjacent to helices in free ends and multiloops (so called dangling ends). Normally (dangles = 1) dangling end energies are assigned only to unpaired bases and a base

cannot participate simultaneously in two dangling ends. In the partition function algorithm `pf_fold()` these checks are neglected. If `dangles` is set to 2, all folding routines will follow this convention. This treatment of dangling ends gives more favorable energies to helices directly adjacent to one another, which can be beneficial since such helices often do engage in stabilizing interactions through co-axial stacking.

If `dangles = 3` co-axial stacking is explicitly included for adjacent helices in multi-loops. The option affects only mfe folding and energy evaluation (`fold()` and `energy_of_structure()`), as well as suboptimal folding (`subopt()`) via re-evaluation of energies. Co-axial stacking with one intervening mismatch is not considered so far.

Default is 2 in most algorithms, partition function algorithms can only handle 0 and 2

#### 11.13.3.3 int tetra\_loop

Include special stabilizing energies for some tri-, tetra- and hexa-loops;.

default is 1.

#### 11.13.3.4 int energy\_set

0 = BP; 1=any mit GC; 2=any mit AU-parameter

If set to 1 or 2: fold sequences from an artificial alphabet ABCD..., where A pairs B, C pairs D, etc. using either GC (1) or AU parameters (2); default is 0, you probably don't want to change it.

#### 11.13.3.5 int oldAliEn

use old alifold energies (with gaps)

#### 11.13.3.6 int ribo

use ribosum matrices

#### 11.13.3.7 char\* RibosumFile

warning this variable will vanish in the future ribosums will be compiled in instead

#### 11.13.3.8 char\* nonstandards

contains allowed non standard base pairs

Lists additional base pairs that will be allowed to form in addition to GC, CG, AU, UA, GU and UG. Nonstandard base pairs are given a stacking energy of 0.

#### 11.13.3.9 double temperature

Rescale energy parameters to a temperature in degC.

Default is 37C. You have to call the `update_..._params()` functions after changing this parameter.

#### 11.13.3.10 int james\_rule

interior loops of size 2 get energy 0.8Kcal and no mismatches, default 1

**11.13.3.11 int logML**

use logarithmic multiloop energy function

**11.13.3.12 int cut\_point**

Marks the position (starting from 1) of the first nucleotide of the second molecule within the concatenated sequence.

To evaluate the energy of a duplex structure (a structure formed by two strands), concatenate the two sequences and set it to the first base of the second strand in the concatenated sequence. The default value of -1 stands for single molecule folding. The cut\_point variable is also used by [PS\\_rna\\_plot\(\)](#) and [PS\\_dot\\_plot\(\)](#) to mark the chain break in postscript plots.

**11.13.3.13 bondT\* base\_pair**

Contains a list of base pairs after a call to [fold\(\)](#).

base\_pair[0].i contains the total number of pairs.

**Deprecated** Do not use this variable anymore!

**11.13.3.14 double\* pr**

A pointer to the base pair probability matrix.

**Deprecated** Do not use this variable anymore!

**11.13.3.15 int\* iindx**

index array to move through pr.

The probability for base i and j to form a pair is in pr[iindx[i]-j].

**Deprecated** Do not use this variable anymore!

**11.13.3.16 double pf\_scale**

A scaling factor used by [pf\\_fold\(\)](#) to avoid overflows.

Should be set to approximately  $\exp((-F/kT)/length)$ , where  $F$  is an estimate for the ensemble free energy, for example the minimum free energy. You must call [update\\_pf\\_params\(\)](#) after changing this parameter.

If pf\_scale is -1 (the default), an estimate will be provided automatically when computing partition functions, e.g. [pf\\_fold\(\)](#). The automatic estimate is usually insufficient for sequences more than a few hundred bases long.

**11.13.3.17 int do\_backtrack**

do backtracking, i.e. compute secondary structures or base pair probabilities

If 0, do not calculate pair probabilities in [pf\\_fold\(\)](#); this is about twice as fast. Default is 1.

**11.13.3.18 char backtrack\_type**

A backtrack array marker for [inverse\\_fold\(\)](#)

If set to 'C': force (1,N) to be paired, 'M' fold as if the sequence were inside a multi-loop. Otherwise ('F') the usual mfe structure is computed.

## 11.13.3.19 int canonicalBPonly

Do not use this variable, it will eventually be removed in one of the next versions

## 11.14 /home/mescal/ronny/WORK/ViennaRNA/H/gquad.h File Reference

Various functions related to G-quadruplex computations.

Include dependency graph for gquad.h:

## Functions

- int \* [get\\_gquad\\_matrix](#) (short \*S, [paramT](#) \*P)  
Get a triangular matrix prefilled with minimum free energy contributions of G-quadruplexes.
- int [parse\\_gquad](#) (const char \*struc, int \*L, int l[3])
- PRIVATE int [backtrack\\_GQuad\\_IntLoop](#) (int c, int i, int j, int type, short \*S, int \*ggg, int \*index, int \*p, int \*q, [paramT](#) \*P)
- PRIVATE int [backtrack\\_GQuad\\_IntLoop\\_L](#) (int c, int i, int j, int type, short \*S, int \*\*ggg, int maxdist, int \*p, int \*q, [paramT](#) \*P)

## 11.14.1 Detailed Description

Various functions related to G-quadruplex computations.

## 11.14.2 Function Documentation

11.14.2.1 int\* get\_gquad\_matrix ( short \* S, [paramT](#) \* P )

Get a triangular matrix prefilled with minimum free energy contributions of G-quadruplexes.

At each position  $ij$  in the matrix, the minimum free energy of any G-quadruplex delimited by  $i$  and  $j$  is stored. If no G-quadruplex formation is possible, the matrix element is set to INF. Access the elements in the matrix via `matrix[indx[jj]+i]`. To get the integer array `indx` see `get_jindx()`.

See also

`get_jindx()`, `encode_sequence()`

#### Parameters

<i>S</i>	The encoded sequence
<i>P</i>	A pointer to the data structure containing the precomputed energy contributions

#### Returns

A pointer to the G-quadruplex contribution matrix

#### 11.14.2.2 `int parse_gquad ( const char * struc, int * L, int l[3] )`

given a dot-bracket structure (possibly) containing gquads encoded by '+' signs, find first gquad, return end position or 0 if none found Upon return `L` and `l[]` contain the number of stacked layers, as well as the lengths of the linker regions. To parse a string with many gquads, call `parse_gquad` repeatedly e.g. `end1 = parse_gquad(struc, &L, l); ... ; end2 = parse_gquad(struc+end1, &L, l); end2+=end1; ... ; end3 = parse_gquad(struc+end2, &L, l); end3+=end2; ... ;`

#### 11.14.2.3 `PRIVATE int backtrack_GQuad_IntLoop ( int c, int i, int j, int type, short * S, int * ggg, int * index, int * p, int * q, paramT * P )`

backtrack an interior loop like enclosed g-quadruplex with closing pair (i,j)

#### Parameters

<i>c</i>	The total contribution the loop should resemble
<i>i</i>	position i of enclosing pair
<i>j</i>	position j of enclosing pair
<i>type</i>	base pair type of enclosing pair (must be reverse type)
<i>S</i>	integer encoded sequence
<i>ggg</i>	triangular matrix containing g-quadruplex contributions
<i>index</i>	the index for accessing the triangular matrix
<i>p</i>	here the 5' position of the gquad is stored
<i>q</i>	here the 3' position of the gquad is stored
<i>P</i>	the datastructure containing the precalculated contributions

#### Returns

1 on success, 0 if no gquad found

#### 11.14.2.4 `PRIVATE int backtrack_GQuad_IntLoop_L ( int c, int i, int j, int type, short * S, int ** ggg, int maxdist, int * p, int * q, paramT * P )`

backtrack an interior loop like enclosed g-quadruplex with closing pair (i,j) with underlying Lfold matrix

## Parameters

<i>c</i>	The total contribution the loop should resemble
<i>i</i>	position i of enclosing pair
<i>j</i>	position j of enclosing pair
<i>type</i>	base pair type of enclosing pair (must be reverse type)
<i>S</i>	integer encoded sequence
<i>ggg</i>	triangular matrix containing g-quadruplex contributions
<i>p</i>	here the 5' position of the gquad is stored
<i>q</i>	here the 3' position of the gquad is stored
<i>P</i>	the datastructure containing the precalculated contributions

## Returns

1 on success, 0 if no gquad found

## 11.15 /home/mescal/ronny/WORK/ViennaRNA/H/inverse.h File Reference

Inverse folding routines.

## Functions

- float [inverse\\_fold](#) (char \*start, const char \*target)  
*Find sequences with predefined structure.*
- float [inverse\\_pf\\_fold](#) (char \*start, const char \*target)  
*Find sequence that maximizes probability of a predefined structure.*

## Variables

- char \* [symbolset](#)  
*This global variable points to the allowed bases, initially "AUGC". It can be used to design sequences from reduced alphabets.*
- float [final\\_cost](#)
- int [give\\_up](#)
- int [inv\\_verbose](#)

## 11.15.1 Detailed Description

Inverse folding routines.

### 11.17.1 Detailed Description

Energy evaluation for MFE and partition function calculations.

This file contains functions for the calculation of the free energy  $\Delta G$  of a hairpin- [ [E\\_Hairpin\(\)](#) ] or interior-loop [ [E\\_IntLoop\(\)](#) ].

The unit of the free energy returned is  $10^{-2} * \text{kcal/mol}$

In case of computing the partition function, this file also supplies functions which return the Boltzmann weights  $e^{-\Delta G/kT}$  for a hairpin- [ [exp\\_E\\_Hairpin\(\)](#) ] or interior-loop [ [exp\\_E\\_IntLoop\(\)](#) ].

### 11.17.2 Function Documentation

11.17.2.1 PRIVATE int [E\\_IntLoop](#) ( int n1, int n2, int type, int type\_2, int si1, int sj1, int sp1, int sq1, [paramT](#) \* P )

Compute the Energy of an interior-loop

This function computes the free energy  $\Delta G$  of an interior-loop with the following structure:

This general structure depicts an interior-loop that is closed by the base pair (X,Y). The enclosed base pair is (V,U) which leaves the unpaired bases a\_1-a\_n and b\_1-b\_n that constitute the loop. In this example, the length of the interior-loop is  $(n + m)$  where n or m may be 0 resulting in a bulge-loop or base pair stack. The mismatching nucleotides for the closing pair (X,Y) are:

5'-mismatch: a\_1

3'-mismatch: b\_m

and for the enclosed base pair (V,U):

5'-mismatch: b\_1

3'-mismatch: a\_n

#### Note

Base pairs are always denoted in 5'->3' direction. Thus the enclosed base pair must be 'turned around' when evaluating the free energy of the interior-loop

#### See also

[scale\\_parameters\(\)](#)  
[paramT](#)

#### Note

This function is threadsafe

#### Parameters

<i>n1</i>	The size of the 'left'-loop (number of unpaired nucleotides)
<i>n2</i>	The size of the 'right'-loop (number of unpaired nucleotides)
<i>type</i>	The pair type of the base pair closing the interior loop
<i>type_2</i>	The pair type of the enclosed base pair
<i>si1</i>	The 5'-mismatching nucleotide of the closing pair
<i>sj1</i>	The 3'-mismatching nucleotide of the closing pair
<i>sp1</i>	The 3'-mismatching nucleotide of the enclosed pair
<i>sq1</i>	The 5'-mismatching nucleotide of the enclosed pair
<i>P</i>	The datastructure containing scaled energy parameters

#### Returns

The Free energy of the Interior-loop in dcal/mol

11.17.2.2 **PRIVATE** int E\_Hairpin ( int size, int type, int si1, int sj1, const char \* string, paramT \* P )

#### Compute the Energy of a hairpin-loop

To evaluate the free energy of a hairpin-loop, several parameters have to be known. A general hairpin-loop has this structure:

```

      a3 a4
    a2   a5
    a1   a6
      X - Y
      |   |
      5'  3'

```

where X-Y marks the closing pair [e.g. a (**G,C**) pair]. The length of this loop is 6 as there are six unpaired nucleotides (a1-a6) enclosed by (X,Y). The 5' mismatching nucleotide is a1 while the 3' mismatch is a6. The nucleotide sequence of this loop is "a1.a2.a3.a4.a5.a6"

#### Note

The parameter sequence should contain the sequence of the loop in capital letters of the nucleic acid alphabet if the loop size is below 7. This is useful for unusually stable tri-, tetra- and hexa-loops which are treated differently (based on experimental data) if they are tabulated.

#### See also

[scale\\_parameters\(\)](#)  
[paramT](#)

#### Warning

Not (really) thread safe! A threadsafe implementation will replace this function in a future release!  
 Energy evaluation may change due to updates in global variable "tetra\_loop"

#### Parameters

<i>size</i>	The size of the loop (number of unpaired nucleotides)
<i>type</i>	The pair type of the base pair closing the hairpin
<i>si1</i>	The 5'-mismatching nucleotide
<i>sj1</i>	The 3'-mismatching nucleotide
<i>string</i>	The sequence of the loop
<i>P</i>	The datastructure containing scaled energy parameters

#### Returns

The Free energy of the Hairpin-loop in dcal/mol

11.17.2.3 **PRIVATE** int E\_Stem ( int *type*, int *si1*, int *sj1*, int *extLoop*, paramT \* *P* )

#### Compute the energy contribution of a stem branching off a loop-region

This function computes the energy contribution of a stem that branches off a loop region. This can be the case in multiloops, when a stem branching off increases the degree of the loop but also *immediately interior base pairs* of an exterior loop contribute free energy. To switch the behavior of the function according to the evaluation of a multiloop- or exterior-loop-stem, you pass the flag 'extLoop'. The returned energy contribution consists of a TerminalAU penalty if the pair type is greater than 2, dangling end contributions of mismatching nucleotides adjacent to the stem if only one of the si1, sj1 parameters is greater than 0 and mismatch energies if both mismatching nucleotides are positive values. Thus, to avoid incooperating dangling end or mismatch energies just pass a negative number, e.g. -1 to the mismatch argument.

This is an illustration of how the energy contribution is assembled:

```

      3'  5'
      |   |
      X - Y
5'-si1      sj1-3'

```

Here, (X,Y) is the base pair that closes the stem that branches off a loop region. The nucleotides si1 and sj1 are the 5'- and 3'- mismatches, respectively. If the base pair type of (X,Y) is greater than 2 (i.e. an A-U or G-U pair, the TerminalAU penalty will be included in the energy contribution returned. If si1 and sj1 are both nonnegative numbers, mismatch energies will also be included. If one of si1 or sj1 is a negative value, only 5' or 3' dangling end contributions are taken into account. To prohibit any of these mismatch contributions to be incorporated, just pass a negative number to both, si1 and sj1. In case the argument extLoop is 0, the returned energy contribution also includes the *internal-loop-penalty* of a multiloop stem with closing pair type.

See also

E\_MLstem()  
E\_ExtLoop()

Note

This function is threadsafe

Parameters

<i>type</i>	The pair type of the first base pair on the stem
<i>si1</i>	The 5'-mismatching nucleotide
<i>sj1</i>	The 3'-mismatching nucleotide
<i>extLoop</i>	A flag that indicates whether the contribution reflects the one of an exterior loop or not
<i>P</i>	The datastructure containing scaled energy parameters

Returns

The Free energy of the branch off the loop in dcal/mol

11.17.2.4 PRIVATE double exp\_E\_Stem ( int *type*, int *si1*, int *sj1*, int *extLoop*, pf\_paramT \* *P* )

Compute the Boltzmann weighted energy contribution of a stem branching off a loop-region

This is the partition function variant of [E\\_Stem\(\)](#)

See also

[E\\_Stem\(\)](#)

Note

This function is threadsafe

Returns

The Boltzmann weighted energy contribution of the branch off the loop

11.17.2.5 PRIVATE double exp\_E\_Hairpin ( int *u*, int *type*, short *si1*, short *sj1*, const char \* *string*, pf\_paramT \* *P* )

Compute Boltzmann weight  $e^{-\Delta G/kT}$  of a hairpin loop

multiply by scale[u+2]

*Computes a MEA (maximum expected accuracy) structure.*

### 11.19.1 Detailed Description

Computes a MEA (maximum expected accuracy) structure.

### 11.19.2 Function Documentation

#### 11.19.2.1 float MEA ( [plist](#) \*p, char \* *structure*, double *gamma* )

Computes a MEA (maximum expected accuracy) structure.

The algorithm maximizes the expected accuracy

$$A(S) = \sum_{(i,j) \in S} 2\gamma p_{ij} + \sum_{i \notin S} p_i^u$$

Higher values of  $\gamma$  result in more base pairs of lower probability and thus higher sensitivity. Low values of  $\gamma$  result in structures containing only highly likely pairs (high specificity). The code of the MEA function also demonstrates the use of sparse dynamic programming scheme to reduce the time and memory complexity of folding.

*Free energies of the two monomers.*

### 11.24.1 Detailed Description

Partition function for two RNA sequences.

As for folding one RNA molecule, this computes the partition function of all possible structures and the base pair probabilities. Uses the same global [pf\\_scale](#) variable to avoid overflows.

To simplify the implementation the partition function computation is done internally in a null model that does not include the duplex initiation energy, i.e. the entropic penalty for producing a dimer from two monomers). The resulting free energies and pair probabilities are initially relative to that null model. In a second step the free energies can be corrected to include the dimerization penalty, and the pair probabilities can be divided into the conditional pair probabilities given that a re dimer is formed or not formed.

After computing the partition functions of all possible dimers one can compute the probabilities of base pairs, the concentrations out of start concentrations and so far and so away.

Dimer formation is inherently concentration dependent. Given the free energies of the monomers A and B and dimers AB, AA, and BB one can compute the equilibrium concentrations, given input concentrations of A and B, see e.g. Dimitrov & Zuker (2004)

- `void free_pu_contrib_struct` (`pu_contrib *pu`)  
*Frees the output of function `pf_unstru()`.*

### 11.25.1 Detailed Description

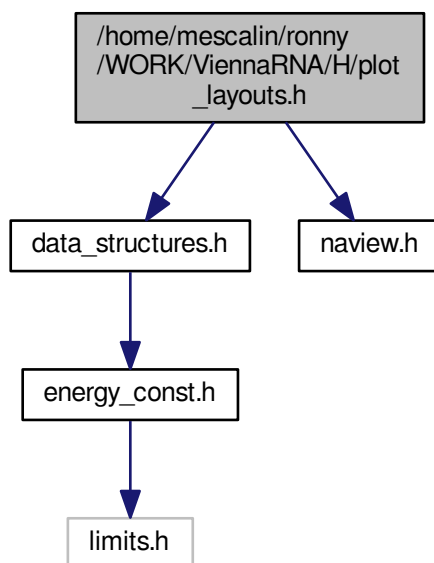

Partition Function Cofolding as stepwise process.

In this approach to cofolding the interaction between two RNA molecules is seen as a stepwise process. In a first step, the target molecule has to adopt a structure in which a binding site is accessible. In a second step, the ligand molecule will hybridize with a region accessible to an interaction. Consequently the algorithm is designed as a two step process: The first step is the calculation of the probability that a region within the target is unpaired, or equivalently, the calculation of the free energy needed to expose a region. In the second step we compute the free energy of an interaction for every possible binding site.

### 11.26.3 Function Documentation

#### 11.26.3.1 int simple\_xy\_coordinates ( short \* pair\_table, float \* X, float \* Y )

Calculate nucleotide coordinates for secondary structure plot the *Simple way*

See also

[make\\_pair\\_table\(\)](#), [rna\\_plot\\_type](#), [simple\\_circplot\\_coordinates\(\)](#), [naview\\_xy\\_coordinates\(\)](#), [PS\\_rna\\_plot\\_a\(\)](#), [PS\\_rna\\_plot](#), [svg\\_rna\\_plot\(\)](#)

Parameters

<i>pair_table</i>	The pair table of the secondary structure
<i>X</i>	a pointer to an array with enough allocated space to hold the x coordinates
<i>Y</i>	a pointer to an array with enough allocated space to hold the y coordinates

Returns

length of sequence on success, 0 otherwise

#### 11.26.3.2 int simple\_circplot\_coordinates ( short \* pair\_table, float \* x, float \* y )

Calculate nucleotide coordinates for *Circular Plot*

This function calculates the coordinates of nucleotides mapped in equal distances onto a unit circle.

Note

In order to draw nice arcs using quadratic bezier curves that connect base pairs one may calculate a second tangential point  $P^t$  in addition to the actual  $R^2$  coordinates. the simplest way to do so may be to compute a radius scaling factor  $rs$  in the interval  $[0, 1]$  that weights the proportion of base pair span to the actual length of the sequence. This scaling factor can then be used to calculate the coordinates for  $P^t$ , i.e.  $P_x^t[i] = X[i] * rs$  and  $P_y^t[i] = Y[i] * rs$ .

See also

[make\\_pair\\_table\(\)](#), [rna\\_plot\\_type](#), [simple\\_xy\\_coordinates\(\)](#), [naview\\_xy\\_coordinates\(\)](#), [PS\\_rna\\_plot\\_a\(\)](#), [P↔S\\_rna\\_plot](#), [svg\\_rna\\_plot\(\)](#)

Parameters

<i>pair_table</i>	The pair table of the secondary structure
<i>x</i>	a pointer to an array with enough allocated space to hold the x coordinates
<i>y</i>	a pointer to an array with enough allocated space to hold the y coordinates

Returns

length of sequence on success, 0 otherwise

### 11.26.4 Variable Documentation

#### 11.26.4.1 int rna\_plot\_type

Switch for changing the secondary structure layout algorithm.

Current possibilities are 0 for a simple radial drawing or 1 for the modified radial drawing taken from the *naview* program of Brucoleri & Heinrich (1988).

**Note**

To provide thread safety please do not rely on this global variable in future implementations but pass a plot type flag directly to the function that decides which layout algorithm it may use!

**See also**

## 11.27 /home/mescal/ronny/WORK/ViennaRNA/H/profiledist.h File Reference

Include dependency graph for profiledist.h:

**Functions**

- float [profile\\_edit\\_distance](#) (const float \*T1, const float \*T2)  
*Align the 2 probability profiles T1, T2*
- float \* [Make\\_bp\\_profile\\_bppm](#) (double \*bppm, int length)  
*condense pair probability matrix into a vector containing probabilities for unpaired, upstream paired and downstream paired.*
- void [print\\_bppm](#) (const float \*T)  
*print string representation of probability profile*
- void [free\\_profile](#) (float \*T)  
*free space allocated in Make\_bp\_profile*
- float \* [Make\\_bp\\_profile](#) (int length)

### 11.27.1 Function Documentation

#### 11.27.1.1 float profile\_edit\_distance ( const float \* T1, const float \* T2 )

Align the 2 probability profiles T1, T2

.

This is like a Needleman-Wunsch alignment, we should really use affine gap-costs ala Gotoh

#### 11.27.1.2 float\* Make\_bp\_profile\_bppm ( double \* bppm, int length )

condense pair probability matrix into a vector containing probabilities for unpaired, upstream paired and downstream paired.

This resulting probability profile is used as input for profile\_edit\_distance

##### Parameters

<i>bppm</i>	A pointer to the base pair probability matrix
<i>length</i>	The length of the sequence

##### Returns

The bp profile

#### 11.27.1.3 void free\_profile ( float \* T )

free space allocated in Make\_bp\_profile

Backward compatibility only. You can just use plain free()

#### 11.27.1.4 float\* Make\_bp\_profile ( int length )

##### Note

This function is NOT threadsafe

##### See also

[Make\\_bp\\_profile\\_bppm\(\)](#)

**Deprecated** This function is deprecated and will be removed soon! See [Make\\_bp\\_profile\\_bppm\(\)](#) for a replacement

## 11.28 /home/mescalini/ronny/WORK/ViennaRNA/H/PS\_dot.h File Reference

Various functions for plotting RNA secondary structures, dot-plots and other visualizations.

Include dependency graph for PS\_dot.h:

## Functions

- `int PS_rna_plot (char *string, char *structure, char *file)`  
Produce a secondary structure graph in PostScript and write it to 'filename'.
- `int PS_rna_plot_a (char *string, char *structure, char *file, char *pre, char *post)`  
Produce a secondary structure graph in PostScript including additional annotation macros and write it to 'filename'.
- `int gmlRNA (char *string, char *structure, char *ssfile, char option)`  
Produce a secondary structure graph in Graph Meta Language (gml) and write it to a file.
- `int ssv_rna_plot (char *string, char *structure, char *ssfile)`  
Produce a secondary structure graph in SStructView format.
- `int svg_rna_plot (char *string, char *structure, char *ssfile)`  
Produce a secondary structure plot in SVG format and write it to a file.
- `int xrna_plot (char *string, char *structure, char *ssfile)`  
Produce a secondary structure plot for further editing in XRNA.
- `int PS_dot_plot_list (char *seq, char *filename, plist *pl, plist *mf, char *comment)`  
Produce a postscript dot-plot from two pair lists.
- `int aliPS_color_aln (const char *structure, const char *filename, const char *seqs[], const char *names[])`
- `int PS_dot_plot (char *string, char *file)`  
Produce postscript dot-plot.

### 11.28.1 Detailed Description

Various functions for plotting RNA secondary structures, dot-plots and other visualizations.

## 11.28.2 Function Documentation

### 11.28.2.1 int PS\_rna\_plot ( char \* *string*, char \* *structure*, char \* *file* )

Produce a secondary structure graph in PostScript and write it to 'filename'.

Note that this function has changed from previous versions and now expects the structure to be plotted in dot-bracket notation as an argument. It does not make use of the global [base\\_pair](#) array anymore.

#### Parameters

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>file</i>	The filename of the postscript output

#### Returns

1 on success, 0 otherwise

### 11.28.2.2 int PS\_rna\_plot\_a ( char \* *string*, char \* *structure*, char \* *file*, char \* *pre*, char \* *post* )

Produce a secondary structure graph in PostScript including additional annotation macros and write it to 'filename'.

Same as [PS\\_rna\\_plot\(\)](#) but adds extra PostScript macros for various annotations (see generated PS code). The 'pre' and 'post' variables contain PostScript code that is verbatim copied in the resulting PS file just before and after the structure plot. If both arguments ('pre' and 'post') are NULL, no additional macros will be printed into the PostScript.

#### Parameters

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>file</i>	The filename of the postscript output
<i>pre</i>	PostScript code to appear before the secondary structure plot
<i>post</i>	PostScript code to appear after the secondary structure plot

#### Returns

1 on success, 0 otherwise

### 11.28.2.3 int gmlRNA ( char \* *string*, char \* *structure*, char \* *ssfile*, char *option* )

Produce a secondary structure graph in Graph Meta Language (gml) and write it to a file.

If 'option' is an uppercase letter the RNA sequence is used to label nodes, if 'option' equals 'X' or 'x' the resulting file will contain coordinates for an initial layout of the graph.

#### Parameters

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the gml output
<i>option</i>	The option flag

#### Returns

1 on success, 0 otherwise

#### 11.28.2.4 int ssv\_rna\_plot ( char \* *string*, char \* *structure*, char \* *ssfile* )

Produce a secondary structure graph in SStructView format.

Write coord file for SStructView

##### Parameters

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the ssv output

##### Returns

1 on success, 0 otherwise

#### 11.28.2.5 int svg\_rna\_plot ( char \* *string*, char \* *structure*, char \* *ssfile* )

Produce a secondary structure plot in SVG format and write it to a file.

##### Parameters

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the svg output

##### Returns

1 on success, 0 otherwise

#### 11.28.2.6 int xrna\_plot ( char \* *string*, char \* *structure*, char \* *ssfile* )

Produce a secondary structure plot for further editing in XRNA.

##### Parameters

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the xrna output

##### Returns

1 on success, 0 otherwise

#### 11.28.2.7 int PS\_dot\_plot\_list ( char \* *seq*, char \* *filename*, plist \* *pl*, plist \* *mf*, char \* *comment* )

Produce a postscript dot-plot from two pair lists.

This function reads two plist structures (e.g. base pair probabilities and a secondary structure) as produced by [assign\\_plist\\_from\\_pr\(\)](#) and [assign\\_plist\\_from\\_db\(\)](#) and produces a postscript "dot plot" that is written to 'filename'. Using base pair probabilities in the first and mfe structure in the second plist, the resulting "dot plot" represents each base pairing probability by a square of corresponding area in a upper triangle matrix. The lower part of the matrix contains the minimum free energy structure.

##### See also

[assign\\_plist\\_from\\_pr\(\)](#), [assign\\_plist\\_from\\_db\(\)](#)

## Parameters

<i>seq</i>	The RNA sequence
<i>filename</i>	A filename for the postscript output
<i>pl</i>	The base pair probability pairlist
<i>mf</i>	The mfe secondary structure pairlist
<i>comment</i>	A comment

## Returns

1 if postscript was successfully written, 0 otherwise

11.28.2.8 `int aliPS_color_aln ( const char * structure, const char * filename, const char * seqs[], const char * names[] )`

PS\_color\_aln for duplexes

11.28.2.9 `int PS_dot_plot ( char * string, char * file )`

Produce postscript dot-plot.

Wrapper to PS\_dot\_plot\_list

Reads base pair probabilities produced by [pf\\_fold\(\)](#) from the global array [pr](#) and the pair list [base\\_pair](#) produced by [fold\(\)](#) and produces a postscript "dot plot" that is written to 'filename'. The "dot plot" represents each base pairing probability by a square of corresponding area in a upper triangle matrix. The lower part of the matrix contains the minimum free energy

## Note

DO NOT USE THIS FUNCTION ANYMORE SINCE IT IS NOT THREADSAFE

**Deprecated** This function is deprecated and will be removed soon! Use [PS\\_dot\\_plot\\_list\(\)](#) instead!

## 11.29 /home/mescalini/ronny/WORK/ViennaRNA/H/read\_epars.h File Reference

## Enumerations

- enum [parset](#)

*Identifiers for energy contribution parameters in parameter files.*

## Functions

- void [read\\_parameter\\_file](#) (const char fname[])  
*Read energy parameters from a file.*
- void [write\\_parameter\\_file](#) (const char fname[])  
*Write energy parameters to a file.*

## 11.30 /home/mescalini/ronny/WORK/ViennaRNA/H/RNAstruct.h File Reference

Parsing and Coarse Graining of Structures.

## Functions

- char \* [b2HIT](#) (const char \*structure)  
*Converts the full structure from bracket notation to the HIT notation including root.*
- char \* [b2C](#) (const char \*structure)  
*Converts the full structure from bracket notation to the a coarse grained notation using the 'H' 'B' 'I' 'M' and 'R' identifiers.*
- char \* [b2Shapiro](#) (const char \*structure)  
*Converts the full structure from bracket notation to the weighted coarse grained notation using the 'H' 'B' 'I' 'M' 'S' 'E' and 'R' identifiers.*
- char \* [add\\_root](#) (const char \*structure)  
*Adds a root to an un-rooted tree in any except bracket notation.*
- char \* [expand\\_Shapiro](#) (const char \*coarse)  
*Inserts missing 'S' identifiers in unweighted coarse grained structures as obtained from [b2C\(\)](#).*
- char \* [expand\\_Full](#) (const char \*structure)  
*Convert the full structure from bracket notation to the expanded notation including root.*
- char \* [unexpand\\_Full](#) (const char \*full)  
*Restores the bracket notation from an expanded full or HIT tree, that is any tree using only identifiers 'U' 'P' and 'R'.*
- char \* [unweight](#) (const char \*wcoarse)  
*Strip weights from any weighted tree.*
- void [unexpand\\_aligned\\_F](#) (char \*align[2])  
*Converts two aligned structures in expanded notation.*
- void [parse\\_structure](#) (const char \*structure)  
*Collects a statistic of structure elements of the full structure in bracket notation.*

## Variables

- int [loop\\_size](#) [STRUC]  
*contains a list of all loop sizes. loop\_size[0] contains the number of external bases.*
- int [helix\\_size](#) [STRUC]  
*contains a list of all stack sizes.*
- int [loop\\_degree](#) [STRUC]  
*contains the corresponding list of loop degrees.*
- int [loops](#)  
*contains the number of loops ( and therefore of stacks ).*
- int [unpaired](#)  
*contains the number of unpaired bases.*
- int [pairs](#)  
*contains the number of base pairs in the last parsed structure.*

### 11.30.1 Detailed Description

#### Parsing and Coarse Graining of Structures.

Example:

```
* .((..(((...)))..((...))). is the bracket or full tree
* becomes expanded: - expand_Full() -
* ((U)((U)(U)((U)(U)P)P)P)(U)(U)((U)(U)P)P)P)(U)R)
* HIT: - b2HIT() -
* ((U1)((U2)((U3)P3)(U2)((U2)P2)P2)(U1)R)
* Coarse: - b2C() -
* ((H)((H)M)R)
* becomes expanded: - expand_Shapiro() -
* (((((H)S)((H)S)M)S)R)
* weighted Shapiro: - b2Shapiro() -
* (((((H3)S3)((H2)S2)M4)S2)E2)R)
*
```

## 11.30.2 Function Documentation

### 11.30.2.1 char\* b2HIT ( const char \* *structure* )

Converts the full structure from bracket notation to the HIT notation including root.

Parameters

<i>structure</i>	
------------------	--

Returns

### 11.30.2.2 char\* b2C ( const char \* *structure* )

Converts the full structure from bracket notation to the a coarse grained notation using the 'H' 'B' 'I' 'M' and 'R' identifiers.

Parameters

<i>structure</i>	
------------------	--

Returns

### 11.30.2.3 char\* b2Shapiro ( const char \* *structure* )

Converts the full structure from bracket notation to the *weighted* coarse grained notation using the 'H' 'B' 'I' 'M' 'S' 'E' and 'R' identifiers.

Parameters

<i>structure</i>	
------------------	--

Returns

### 11.30.2.4 char\* add\_root ( const char \* *structure* )

Adds a root to an un-rooted tree in any except bracket notation.

Parameters

<i>structure</i>	
------------------	--

Returns

### 11.30.2.5 char\* expand\_Shapiro ( const char \* *coarse* )

Inserts missing 'S' identifiers in unweighted coarse grained structures as obtained from [b2C\(\)](#).

## Parameters

<i>coarse</i>	
---------------	--

## Returns

11.30.2.6 char\* expand\_Full ( const char \* *structure* )

Convert the full structure from bracket notation to the expanded notation including root.

## Parameters

<i>structure</i>	
------------------	--

## Returns

11.30.2.7 char\* unexpand\_Full ( const char \* *ffull* )

Restores the bracket notation from an expanded full or HIT tree, that is any tree using only identifiers 'U' 'P' and 'R'.

## Parameters

<i>ffull</i>	
--------------	--

## Returns

11.30.2.8 char\* unweight ( const char \* *wcoarse* )

Strip weights from any weighted tree.

## Parameters

<i>wcoarse</i>	
----------------	--

## Returns

11.30.2.9 void unexpand\_aligned\_F ( char \* *align*[2] )

Converts two aligned structures in expanded notation.

Takes two aligned structures as produced by [tree\\_edit\\_distance\(\)](#) function back to bracket notation with '\_' as the gap character. The result overwrites the input.

## Parameters

<i>align</i>	
--------------	--

11.30.2.10 void parse\_structure ( const char \* *structure* )

Collects a statistic of structure elements of the full structure in bracket notation.

The function writes to the following global variables: [loop\\_size](#), [loop\\_degree](#), [helix\\_size](#), [loops](#), [pairs](#), [unpaired](#)

## Parameters

<i>structure</i>	
------------------	--

## Returns

## 11.31 /home/mescal/ronny/WORK/ViennaRNA/H/stringdist.h File Reference

Functions for String Alignment.

Include dependency graph for stringdist.h:

### Functions

- [swString](#) \* [Make\\_swString](#) (char \*string)  
Convert a structure into a format suitable for [string\\_edit\\_distance\(\)](#).
- float [string\\_edit\\_distance](#) ([swString](#) \*T1, [swString](#) \*T2)  
Calculate the string edit distance of T1 and T2.

### 11.31.1 Detailed Description

Functions for String Alignment.

### 11.31.2 Function Documentation

#### 11.31.2.1 **swString\*** **Make\_swString** ( **char** \* *string* )

Convert a structure into a format suitable for [string\\_edit\\_distance\(\)](#).

## Parameters

<i>string</i>	
---------------	--

## Returns

11.31.2.2 float string\_edit\_distance ( swString \* T1, swString \* T2 )

Calculate the string edit distance of T1 and T2.

## Parameters

<i>T1</i>	
<i>T2</i>	

## Returns

## 11.32 /home/mescal/ronny/WORK/ViennaRNA/H/subopt.h File Reference

RNAsubopt and density of states declarations.

Include dependency graph for subopt.h:

## Functions

- **SOLUTION** \* subopt (char \*seq, char \*structure, int delta, FILE \*fp)  
Returns list of subopt structures or writes to fp.

- **SOLUTION** \* **subopt\_par** (char \*seq, char \*structure, **paramT** \*parameters, int delta, int is\_constrained, int is\_circular, FILE \*fp)  
*Returns list of subopt structures or writes to fp.*
- **SOLUTION** \* **subopt\_circ** (char \*seq, char \*sequence, int delta, FILE \*fp)  
*Returns list of circular subopt structures or writes to fp.*

## Variables

- int **subopt\_sorted**  
*Sort output by energy.*
- double **print\_energy**  
*printing threshold for use with logML*
- int **density\_of\_states** [MAXDOS+1]  
*The Density of States.*

### 11.32.1 Detailed Description

RNAsubopt and density of states declarations.

## 11.33 /home/mescal/ronny/WORK/ViennaRNA/H/treedist.h File Reference

Functions for **Tree** Edit Distances.

Include dependency graph for treedist.h:

## Functions

- **Tree** \* **make\_tree** (char \*struc)  
*Constructs a **Tree** (essentially the postorder list) of the structure 'struc', for use in **tree\_edit\_distance**().*
- float **tree\_edit\_distance** (**Tree** \*T1, **Tree** \*T2)  
*Calculates the edit distance of the two trees.*
- void **print\_tree** (**Tree** \*t)  
*Print a tree (mainly for debugging)*
- void **free\_tree** (**Tree** \*t)  
*Free the memory allocated for **Tree** t.*

### 11.33.1 Detailed Description

Functions for [Tree](#) Edit Distances.

### 11.33.2 Function Documentation

#### 11.33.2.1 `Tree* make_tree ( char * struc )`

Constructs a [Tree](#) ( essentially the postorder list ) of the structure 'struc', for use in [tree\\_edit\\_distance\(\)](#).

Parameters

<i>struc</i>	may be any rooted structure representation.
--------------	---

Returns

#### 11.33.2.2 `float tree_edit_distance ( Tree * T1, Tree * T2 )`

Calculates the edit distance of the two trees.

Parameters

<i>T1</i>	
<i>T2</i>	

Returns

#### 11.33.2.3 `void free_tree ( Tree * t )`

Free the memory allocated for [Tree](#) t.

Parameters

<i>t</i>	
----------	--

## 11.34 /home/mescalin/ronny/WORK/ViennaRNA/H/utls.h File Reference

*Maximum length of filenames that are generated by our programs.*
- #define `FILENAME_ID_LENGTH` 42
 

*Maximum length of id taken from fasta header for filename generation.*

## Functions

- void \* [space](#) (unsigned size)  
*Allocate space safely.*
- void \* [xrealloc](#) (void \*p, unsigned size)  
*Reallocate space safely.*
- void [nrerror](#) (const char message[ ])  
*Die with an error message.*
- void [warn\\_user](#) (const char message[ ])  
*Print a warning message.*
- void [init\\_rand](#) (void)  
*Make random number seeds.*
- double [urn](#) (void)  
*get a random number from [0..1]*
- int [int\\_urn](#) (int from, int to)  
*Generates a pseudo random integer in a specified range.*
- char \* [time\\_stamp](#) (void)  
*Get a timestamp.*
- char \* [random\\_string](#) (int l, const char symbols[ ])  
*Create a random string using characters from a specified symbol set.*
- int [hamming](#) (const char \*s1, const char \*s2)  
*Calculate hamming distance between two sequences.*
- int [hamming\\_bound](#) (const char \*s1, const char \*s2, int n)  
*Calculate hamming distance between two sequences up to a specified length.*
- char \* [get\\_line](#) (FILE \*fp)  
*Read a line of arbitrary length from a stream.*
- unsigned int [get\\_input\\_line](#) (char \*\*string, unsigned int options)
- unsigned int [read\\_record](#) (char \*\*header, char \*\*sequence, char \*\*\*rest, unsigned int options)  
*Get a data record from stdin.*
- char \* [pack\\_structure](#) (const char \*struc)  
*Pack secondary secondary structure, 5:1 compression using base 3 encoding.*
- char \* [unpack\\_structure](#) (const char \*packed)  
*Unpack secondary structure previously packed with [pack\\_structure\(\)](#)*
- short \* [make\\_pair\\_table](#) (const char \*structure)  
*Create a pair table of a secondary structure.*
- short \* [copy\\_pair\\_table](#) (const short \*pt)  
*Get an exact copy of a pair table.*
- short \* [alimake\\_pair\\_table](#) (const char \*structure)
- short \* [make\\_pair\\_table\\_snoop](#) (const char \*structure)
- int \* [make\\_loop\\_index\\_pt](#) (short \*pt)  
*Compute the "base pair" distance between two secondary structures s1 and s2.*
- void [print\\_tty\\_input\\_seq](#) (void)  
*Print a line to stdout that asks for an input sequence.*
- void [print\\_tty\\_input\\_seq\\_str](#) (const char \*s)  
*Print a line with a user defined string and a ruler to stdout.*
- void [print\\_tty\\_constraint\\_full](#) (void)  
*Print structure constraint characters to stdout (full constraint support)*
- void [print\\_tty\\_constraint](#) (unsigned int option)  
*Print structure constraint characters to stdout. (constraint support is specified by option parameter)*
- void [str\\_DNA2RNA](#) (char \*sequence)  
*Convert a DNA input sequence to RNA alphabet.*

- void `str_uppercase` (char \*sequence)  
*Convert an input sequence to uppercase.*
- int \* `get_iindx` (unsigned int length)  
*Get an index mapper array (iindx) for accessing the energy matrices, e.g. in partition function related functions.*
- int \* `get_indx` (unsigned int length)  
*Get an index mapper array (indx) for accessing the energy matrices, e.g. in MFE related functions.*
- void `constrain_ptypes` (const char \*constraint, unsigned int length, char \*ptype, int \*BP, int min\_loop\_size, unsigned int idx\_type)  
*Insert constraining pair types according to constraint structure string.*

## Variables

- unsigned short `xsubi` [3]  
*Current 48 bit random number.*

### 11.34.1 Detailed Description

Various utility- and helper-functions used throughout the Vienna RNA package.

### 11.34.2 Macro Definition Documentation

#### 11.34.2.1 `#define VRNA_INPUT_ERROR 1U`

Output flag of `get_input_line()`: "An ERROR has occurred, maybe EOF"

#### 11.34.2.2 `#define VRNA_INPUT_QUIT 2U`

Output flag of `get_input_line()`: "the user requested quitting the program"

#### 11.34.2.3 `#define VRNA_INPUT_MISC 4U`

Output flag of `get_input_line()`: "something was read"

#### 11.34.2.4 `#define VRNA_INPUT_FASTA_HEADER 8U`

Input/Output flag of `get_input_line()`:  
if used as input option this tells `get_input_line()` that the data to be read should comply with the FASTA format  
the function will return this flag if a fasta header was read

#### 11.34.2.5 `#define VRNA_INPUT_SEQUENCE 16U`

Input flag for `get_input_line()`:  
Tell `get_input_line()` that we assume to read a nucleotide sequence

#### 11.34.2.6 `#define VRNA_INPUT_CONSTRAINT 32U`

Input flag for `get_input_line()`:  
Tell `get_input_line()` that we assume to read a structure constraint

11.34.2.7 `#define VRNA_INPUT_NO_TRUNCATION 256U`

Input switch for `get_input_line()`: "do not truncate the line by eliminating white spaces at end of line"

11.34.2.8 `#define VRNA_INPUT_NO_REST 512U`

Input switch for `read_record()`: "do fill rest array"

11.34.2.9 `#define VRNA_INPUT_NO_SPAN 1024U`

Input switch for `read_record()`: "never allow data to span more than one line"

11.34.2.10 `#define VRNA_INPUT_NOSKIP_BLANK_LINES 2048U`

Input switch for `read_record()`: "do not skip empty lines"

11.34.2.11 `#define VRNA_INPUT_BLANK_LINE 4096U`

Output flag for `read_record()`: "read an empty line"

11.34.2.12 `#define VRNA_INPUT_NOSKIP_COMMENTS 128U`

Input switch for `get_input_line()`: "do not skip comment lines"

11.34.2.13 `#define VRNA_INPUT_COMMENT 8192U`

Output flag for `read_record()`: "read a comment"

11.34.2.14 `#define VRNA_CONSTRAINT_PIPE 1U`

pipe sign '|' switch for structure constraints (paired with another base)

11.34.2.15 `#define VRNA_CONSTRAINT_DOT 2U`

dot '.' switch for structure constraints (no constraint at all)

11.34.2.16 `#define VRNA_CONSTRAINT_X 4U`

'x' switch for structure constraint (base must not pair)

11.34.2.17 `#define VRNA_CONSTRAINT_ANG_BRACK 8U`

angle brackets '<', '>' switch for structure constraint (paired downstream/upstream)

11.34.2.18 `#define VRNA_CONSTRAINT_RND_BRACK 16U`

round brackets '(', ')' switch for structure constraint (base i pairs base j)

11.34.2.19 `#define VRNA_CONSTRAINT_MULTILINE 32U`

constraint may span over several lines

11.34.2.20 `#define VRNA_CONSTRAINT_NO_HEADER 64U`

do not print the header information line

11.34.2.21 `#define VRNA_CONSTRAINT_ALL 128U`

placeholder for all constraining characters

11.34.2.22 `#define VRNA_CONSTRAINT_G 256U`

'+' switch for structure constraint (base is involved in a gquad)

11.34.2.23 `#define VRNA_OPTION_MULTILINE 32U`

Tell a function that an input is assumed to span several lines if used as input-option A function might also be returning this state telling that it has read data from multiple lines.

See also

`extract_record_rest_structure()`, [read\\_record\(\)](#), `getConstraint()`

11.34.2.24 `#define MIN2( A, B ) ((A) < (B) ? (A) : (B))`

Get the minimum of two comparable values

11.34.2.25 `#define MAX2( A, B ) ((A) > (B) ? (A) : (B))`

Get the maximum of two comparable values

11.34.2.26 `#define MIN3( A, B, C ) (MIN2( (MIN2((A),(B))), (C)))`

Get the minimum of three comparable values

11.34.2.27 `#define MAX3( A, B, C ) (MAX2( (MAX2((A),(B))), (C)))`

Get the maximum of three comparable values

11.34.2.28 `#define XSTR( s ) STR(s)`

Stringify a macro after expansion

11.34.2.29 `#define STR( s ) #s`

Stringify a macro argument

**11.34.2.30 #define FILENAME\_MAX\_LENGTH 80**

Maximum length of filenames that are generated by our programs.

This definition should be used throughout the complete ViennaRNA package wherever a static array holding filenames of output files is declared.

**11.34.2.31 #define FILENAME\_ID\_LENGTH 42**

Maximum length of id taken from fasta header for filename generation.

this has to be smaller than FILENAME\_MAX\_LENGTH since in most cases, some suffix will be appended to the ID

**11.34.3 Function Documentation****11.34.3.1 void\* space ( unsigned size )**

Allocate space safely.

Parameters

<i>size</i>	The size of the memory to be allocated in bytes
-------------	---

Returns

A pointer to the allocated memory

**11.34.3.2 void\* xrealloc ( void \* p, unsigned size )**

Reallocate space safely.

Parameters

<i>p</i>	A pointer to the memory region to be reallocated
<i>size</i>	The size of the memory to be allocated in bytes

Returns

A pointer to the newly allocated memory

**11.34.3.3 void nerror ( const char message[] )**

Die with an error message.

See also

[warn\\_user\(\)](#)

Parameters

<i>message</i>	The error message to be printed before exiting with 'FAILURE'
----------------	---

**11.34.3.4 void warn\_user ( const char message[] )**

Print a warning message.

Print a warning message to *stderr*

## Parameters

<i>message</i>	The warning message
----------------	---------------------

11.34.3.5 `double urn ( void )`

get a random number from [0..1]

## Note

Usually implemented by calling *erand48()*.

## Returns

A random number in range [0..1]

11.34.3.6 `int int_urn ( int from, int to )`

Generates a pseudo random integer in a specified range.

## Parameters

<i>from</i>	The first number in range
<i>to</i>	The last number in range

## Returns

A pseudo random number in range [from, to]

11.34.3.7 `char* time_stamp ( void )`

Get a timestamp.

Returns a string containing the current date in the format

```
Fri Mar 19 21:10:57 1993
```

## Returns

A string containing the timestamp

11.34.3.8 `char* random_string ( int l, const char symbols[] )`

Create a random string using characters from a specified symbol set.

## Parameters

<i>l</i>	The length of the sequence
<i>symbols</i>	The symbol set

## Returns

A random string of length 'l' containing characters from the symbolset

11.34.3.9 int hamming ( const char \* s1, const char \* s2 )

Calculate hamming distance between two sequences.

Calculate the number of positions in which

**Parameters**

<i>s1</i>	The first sequence
<i>s2</i>	The second sequence

**Returns**

The hamming distance between *s1* and *s2*

**11.34.3.10 int hamming\_bound ( const char \* *s1*, const char \* *s2*, int *n* )**

Calculate hamming distance between two sequences up to a specified length.

This function is similar to [hamming\(\)](#) but instead of comparing both sequences up to their actual length only the first 'n' characters are taken into account

**Parameters**

<i>s1</i>	The first sequence
<i>s2</i>	The second sequence

**Returns**

The hamming distance between *s1* and *s2*

**11.34.3.11 char\* get\_line ( FILE \* *fp* )**

Read a line of arbitrary length from a stream.

Returns a pointer to the resulting string. The necessary memory is allocated and should be released using *free()* when the string is no longer needed.

**Parameters**

<i>fp</i>	A file pointer to the stream where the function should read from
-----------	--

**Returns**

A pointer to the resulting string

**11.34.3.12 unsigned int get\_input\_line ( char \*\* *string*, unsigned int *options* )**

Retrieve a line from 'stdin' safely while skipping comment characters and other features This function returns the type of input it has read if recognized. An option argument allows to switch between different reading modes.

Currently available options are:

#VRNA\_INPUT\_NOPRINT\_COMMENTS, [VRNA\\_INPUT\\_NOSKIP\\_COMMENTS](#), #VRNA\_INPUT\_NOELIM\_WS\_SUFFIX

pass a collection of options as one value like this:

```
get_input_line(string, option_1 | option_2 | option_n)
```

If the function recognizes the type of input, it will report it in the return value. It also reports if a user defined 'quit' command (@-sign on 'stdin') was given. Possible return values are:

[VRNA\\_INPUT\\_FASTA\\_HEADER](#), [VRNA\\_INPUT\\_ERROR](#), [VRNA\\_INPUT\\_MISC](#), [VRNA\\_INPUT\\_QUIT](#)

## Parameters

<i>string</i>	A pointer to the character array that contains the line read
<i>options</i>	A collection of options for switching the functions behavior

## Returns

A flag with information about what has been read

## 11.34.3.13 unsigned int read\_record ( char \*\* header, char \*\* sequence, char \*\*\* rest, unsigned int options )

Get a data record from stdin.

This function may be used to obtain complete datasets from stdin. A dataset is always defined to contain at least a sequence. If data on stdin starts with a fasta header, i.e. a line like

```
>some header info
```

then `read_record()` will assume that the sequence that follows the header may span over several lines. To disable this behavior and to assign a single line to the argument 'sequence' one can pass `VRNA_INPUT_NO_SPAN` in the 'options' argument. If no fasta header is read in the beginning of a data block, a sequence must not span over multiple lines!

Unless the options `VRNA_INPUT_NOSKIP_COMMENTS` or `VRNA_INPUT_NOSKIP_BLANK_LINES` are passed, a sequence may be interrupted by lines starting with a comment character or empty lines.

A sequence is regarded as completely read if it was either assumed to not span over multiple lines, a secondary structure or structure constraint follows the sequence on the next line or a new header marks the beginning of a new sequence...

All lines following the sequence (this includes comments) and not initiating a new dataset are available through the line-array 'rest'. Here one can usually find the structure constraint or other information belonging to the current dataset. Filling of 'rest' may be prevented by passing `VRNA_INPUT_NO_REST` to the options argument.

## Note

This function will exit any program with an error message if no sequence could be read!

The main purpose of this function is to be able to easily parse blocks of data from stdin in the header of a loop where all calculations for the appropriate data is done inside the loop. The loop may be then left on certain return values, e.g.:

```
char *id, *seq, **rest;
int i;
while(!(read_record(&id, &seq, &rest, 0) & (VRNA_INPUT_ERROR | VRNA_INPUT_QUIT))){
    if(id) printf("%s\n", id);
    printf("%s\n", seq);
    if(rest)
        for(i=0;rest[i];i++)
            printf("%s\n", rest[i]);
}
```

In the example above, the while loop will be terminated when `read_record()` returns either an error or a user initiated quit request.

As long as data is read from stdin, the id is printed if it is available for the current block of data. The sequence will be printed in any case and if some more lines belong to the current block of data each line will be printed as well.

\note Do not forget to free the memory occupied by header, sequence and rest!

```
\param header    A pointer which will be set such that it points to the header of the record
\param sequence  A pointer which will be set such that it points to the sequence of the record
\param rest      A pointer which will be set such that it points to an array of lines which also belong to the record
\param options   Some options which may be passed to alter the behavior of the function, use 0 for no options
\return         A flag with information about what the function actually did read
```

#### 11.34.3.14 `char* pack_structure ( const char * struc )`

Pack secondary structure, 5:1 compression using base 3 encoding.

Returns a binary string encoding of the secondary structure using a 5:1 compression scheme. The string is NULL terminated and can therefore be used with standard string functions such as `strcmp()`. Useful for programs that need to keep many structures in memory.

##### Parameters

<i>struc</i>	The secondary structure in dot-bracket notation
--------------	---

##### Returns

The binary encoded structure

#### 11.34.3.15 `char* unpack_structure ( const char * packed )`

Unpack secondary structure previously packed with [pack\\_structure\(\)](#)

Translate a compressed binary string produced by [pack\\_structure\(\)](#) back into the familiar dot-bracket notation.

##### Parameters

<i>packed</i>	The binary encoded packed secondary structure
---------------	---

##### Returns

The unpacked secondary structure in dot-bracket notation

#### 11.34.3.16 `short* make_pair_table ( const char * structure )`

Create a pair table of a secondary structure.

Returns a newly allocated table, such that `table[i]=j` if (i,j) pair or 0 if i is unpaired, `table[0]` contains the length of the structure.

##### Parameters

<i>structure</i>	The secondary structure in dot-bracket notation
------------------	---

##### Returns

A pointer to the created `pair_table`

#### 11.34.3.17 `short* copy_pair_table ( const short * pt )`

Get an exact copy of a pair table.

##### Parameters

<i>pt</i>	The pair table to be copied
-----------	-----------------------------

##### Returns

A pointer to the copy of 'pt'

11.34.3.18 short\* alimake\_pair\_table ( const char \* *structure* )

Pair table for snoop align

11.34.3.19 short\* make\_pair\_table\_snoop ( const char \* *structure* )

returns a newly allocated table, such that: table[i]=j if (i,j) pair or 0 if i is unpaired, table[0] contains the length of the structure. The special pseudoknotted H/ACA-mRNA structure is taken into account.

11.34.3.20 int\* make\_loop\_index\_pt ( short \* *pt* )

Compute the "base pair" distance between two secondary structures s1 and s2.

The sequences should have the same length. dist = number of base pairs in one structure but not in the other same as edit distance with open-pair close-pair as move-set

Parameters

<i>str1</i>	First structure in dot-bracket notation
<i>str2</i>	Second structure in dot-bracket notation

Returns

The base pair distance between str1 and str2

11.34.3.21 void print\_tty\_input\_seq ( void )

Print a line to *stdout* that asks for an input sequence.

There will also be a ruler (scale line) printed that helps orientation of the sequence positions

11.34.3.22 void print\_tty\_input\_seq\_str ( const char \* *s* )

Print a line with a user defined string and a ruler to stdout.

(usually this is used to ask for user input) There will also be a ruler (scale line) printed that helps orientation of the sequence positions

Parameters

<i>s</i>	A user defined string that will be printed to stdout
----------	--

11.34.3.23 void print\_tty\_constraint ( unsigned int *option* )

Print structure constraint characters to stdout. (constraint support is specified by option parameter)

Currently available options are:

- [VRNA\\_CONSTRAINT\\_PIPE](#) (paired with another base)
- [VRNA\\_CONSTRAINT\\_DOT](#) (no constraint at all)
- [VRNA\\_CONSTRAINT\\_X](#) (base must not pair)
- [VRNA\\_CONSTRAINT\\_ANG\\_BRACK](#) (paired downstream/upstream)
- [VRNA\\_CONSTRAINT\\_RND\\_BRACK](#) (base i pairs base j)

pass a collection of options as one value like this:

```
print_tty_constraint(option_1 | option_2 | option_n)
```

## Parameters

<i>option</i>	Option switch that tells which constraint help will be printed
---------------	--

11.34.3.24 void str\_DNA2RNA ( char \* *sequence* )

Convert a DNA input sequence to RNA alphabet.

This function substitutes *T* and *t* with *U* and *u*, respectively

## Parameters

<i>sequence</i>	The sequence to be converted
-----------------	------------------------------

11.34.3.25 void str\_uppercase ( char \* *sequence* )

Convert an input sequence to uppercase.

## Parameters

<i>sequence</i>	The sequence to be converted
-----------------	------------------------------

11.34.3.26 int\* get\_iindx ( unsigned int *length* )

Get an index mapper array (iindx) for accessing the energy matrices, e.g. in partition function related functions.

Access of a position "(i,j)" is then accomplished by using

```
(i,j) ~ iindx[i]-j
```

This function is necessary as most of the two-dimensional energy matrices are actually one-dimensional arrays throughout the ViennaRNAPackage

Consult the implemented code to find out about the mapping formula ;)

## See also

[get\\_indx\(\)](#)

## Parameters

<i>length</i>	The length of the RNA sequence
---------------	--------------------------------

## Returns

The mapper array

11.34.3.27 int\* get\_indx ( unsigned int *length* )

Get an index mapper array (indx) for accessing the energy matrices, e.g. in MFE related functions.

Access of a position "(i,j)" is then accomplished by using

```
(i,j) ~ indx[j]+i
```

This function is necessary as most of the two-dimensional energy matrices are actually one-dimensional arrays throughout the ViennaRNAPackage

Consult the implemented code to find out about the mapping formula ;)

See also

[get\\_iindx\(\)](#)

Parameters

<i>length</i>	The length of the RNA sequence
---------------	--------------------------------

Returns

The mapper array

**11.34.3.28** void constrain\_ptypes ( const char \* *constraint*, unsigned int *length*, char \* *ptype*, int \* *BP*, int *min\_loop\_size*, unsigned int *idx\_type* )

Insert constraining pair types according to constraint structure string.

See also

[get\\_indx\(\)](#), [get\\_iindx\(\)](#)

Parameters

<i>constraint</i>	The structure constraint string
<i>length</i>	The actual length of the sequence (constraint may be shorter)
<i>ptype</i>	A pointer to the basepair type array
<i>min_loop_size</i>	The minimal loop size (usually <a href="#">TURN</a> )
<i>idx_type</i>	Define the access type for base pair type array (0 = indx, 1 = iindx)

#### 11.34.4 Variable Documentation

**11.34.4.1** unsigned short xsubi[3]

Current 48 bit random number.

This variable is used by [urn\(\)](#). These should be set to some random number seeds before the first call to [urn\(\)](#).

See also

[urn\(\)](#)

### 11.35 /home/mescalini/ronny/WORK/ViennaRNA/lib/1.8.4\_epars.h File Reference

Free energy parameters for parameter file conversion.

#### 11.35.1 Detailed Description

Free energy parameters for parameter file conversion.

This file contains the free energy parameters used in ViennaRNAPackage 1.8.4. They are summarized in:

D.H.Mathews, J. Sabina, M. ZUker, D.H. Turner "Expanded sequence dependence of thermodynamic parameters improves prediction of RNA secondary structure" JMB, 288, pp 911-940, 1999

Enthalpies taken from:

A. Walter, D Turner, J Kim, M Lyttle, P M"uller, D Mathews, M Zuker "Coaxial stckaing of helices enhances binding of oligoribonucleotides.." PNAS, 91, pp 9218-9222, 1994
