

# Approaching 3D RNA Structure Prediction

Peter Kerpedjiev

TBI, University of Vienna

February 18, 2012

# How do we predict 3D Structures

# How do we predict 3D Structures

Start with a structure and repeat the following lots of times.

# How do we predict 3D Structures

Start with a structure and repeat the following lots of times.

- 1 Change the structure slightly

# How do we predict 3D Structures

Start with a structure and repeat the following lots of times.

- 1 Change the structure slightly
- 2 Evaluate its quality (Energy)

# How do we predict 3D Structures

Start with a structure and repeat the following lots of times.

- 1 Change the structure slightly
- 2 Evaluate its quality (Energy)
- 3 Decide if we like it (Metropolis criterion)
  - If yes, keep it
  - If no, reverse the change from step 1
- 4 Go back to step 1

# Exercise 1

What does this RNA look like in 3D?

# Exercise 1

What does this RNA look like in 3D?

## Exercise 2

What about this one?

## Exercise 2

What about this one?

## Exercise 3

And finally... this one?

## Exercise 3

And finally... this one?

# Key Features

Why do these two molecules fold so differently?

# Key Features

Small elements lead to large changes in the 3D structure

- 
- 

# Key Features

Small elements lead to large changes in the 3D structure

- Bending
- 

# Key Features

Small elements lead to large changes in the 3D structure

- Bending
- Long range interactions

# Are These Features Useful in 3D Modelling

Long range interactions inferred from mutate and map experiments <sup>1</sup>

Secondary Structure

Native Structure (1Y26)

# Are These Features Useful in 3D Modelling

What about the bends?

# Are These Features Useful in 3D Modelling

What about the bends?

- Where are they likely to occur?

# Are These Features Useful in 3D Modelling

What about the bends?

- Where are they likely to occur?
- How do we characterize them?

# Bend/Kink Modelling

Where are bends/kinks likely to occur?

How do we characterize them?

# Bend/Kink Modelling

Where are bends/kinks likely to occur?

- In bulge regions

How do we characterize them?

# Bend/Kink Modelling

Where are bends/kinks likely to occur?

- In bulge regions
- In branching regions

How do we characterize them?

# Bend/Kink Modelling

Where are bends/kinks likely to occur?

- In bulge regions
- In branching regions

How do we characterize them?

- Distance Constraints

# Bend/Kink Modelling

Where are bends/kinks likely to occur?

- In bulge regions
- In branching regions

How do we characterize them?

- Distance Constraints
- Non-canonical Base Pairs

# What is a distance constraint?

# What is a distance constraint?

- It's a modification of the energy function.
- High energy when two atoms are not the ideal distance apart
- Low energy when they are the ideal distance

# Selecting Non-canonical Base Pair Constraints

## Problem

Which non-canonical base pairs do we include? How exactly do we include them?

## Solution

Find a common constraint among all particular base pair types. For example, the distribution of distances between particular nucleotide atoms.

# Non-canonical Base Pair Distance Distribution

Type	$\mu$	$\sigma$	%
CG W <sub>w</sub> /W <sub>w</sub>	10.60	0.17	45%
AU W <sub>w</sub> /W <sub>w</sub>	10.45	0.22	43%
GU W <sub>w</sub> /W <sub>w</sub>	10.41	0.19	5%
AG H <sub>h</sub> /S <sub>s</sub>	9.37	0.27	5%
AG S <sub>s</sub> /S <sub>s</sub>	8.17	0.17	2%
AU H <sub>h</sub> /W <sub>s</sub>	9.60	0.15	2%

The distribution of C1\*-C1\* distances in various base pair types (as annotated by MC-Annotate):

## Non-canonical Base Pair Distance Distribution

Type	$\mu$	$\sigma$	%
CG W <sub>w</sub> /W <sub>w</sub>	10.60	0.17	45%
AU W <sub>w</sub> /W <sub>w</sub>	10.45	0.22	43%
GU W <sub>w</sub> /W <sub>w</sub>	10.41	0.19	5%
AG H <sub>h</sub> /S <sub>s</sub>	9.37	0.27	5%
AG S <sub>s</sub> /S <sub>s</sub>	8.17	0.17	2%
AU H <sub>h</sub> /W <sub>s</sub>	9.60	0.15	2%

The distribution of C1\*-C1\* distances in various base pair types (as annotated by MC-Annotate):

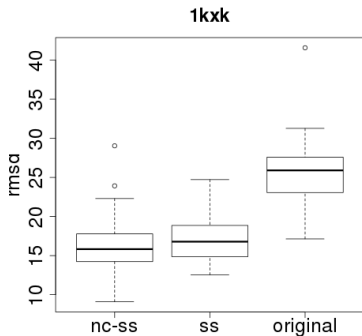

# Results

Adding the non-canonical base pair constraints lowers the mean and minimum rmsd of sampled structures.

# Results

Adding the non-canonical base pair constraints lowers the mean and minimum rmsd of sampled structures.

**Next:** Use predicted non-canonical interactions, along with a more diverse test set.

## Results

Using real non-canonical base pair constraints improves structure prediction.

### 1L2X

Information Provided	Minimum RMSD
Sequence	10.3
+ Secondary Structure	7.2
+ Noncanonical Bases	5.3

### 1KXK

Information Provided	Minimum RMSD
Sequence	17.1
+ Secondary Structure	12.5
+ Noncanonical Bases	9.1

# Secondary Structure Prediction Failure

**Q:** Why is the red base pair predicted but not actually present?

## Secondary Structure Prediction Failure

**Q:** Why is the red base pair predicted but not actually present?

**A:** Steric hinderance and non-canonical interactions.

# Possible Solution: Modified Constraints As Bonuses

- Give bonuses for correct base pairs.
- Don't penalize incorrect base pairs.
- Potentially vary bonus as a function of base pair probability.

# Application

Real

Predicted

Ideally, the major energy contribution will be from the large groups of high confidence base pair prediction bonuses.

# Current Methods

**MC-Fold | MC-Sym:** Sequence → Secondary Structure → 3D Structure  
(using nucleic cyclic motifs)<sup>2</sup>

# Current Methods

## NAST: Nucleic Acid Simulation Tool <sup>3</sup>

- Coarse grained model using knowledge-based potential
- Works reasonably well when long range tertiary interactions are known

# Current Methods

**FARNA / FARFAR: Fragment Assembly of RNA / Fragment Assembly of RNA with Full-Atom Refinement**

- Based on the popular Rosetta protein modelling tool
- Very good at predicting small RNA structures

1ESY

1L2X

# Summary

- RNA Structure Prediction tools exist

# Summary

- RNA Structure Prediction tools exist
- None of them are very good

# Summary

- RNA Structure Prediction tools exist
- None of them are very good
- Non-canonical constraints improve structure prediction

# Summary

- RNA Structure Prediction tools exist
- None of them are very good
- Non-canonical constraints improve structure prediction
- Sub optimal base pair bonuses will be tried in the near future
