Homologous function - homologous folding trajectories?

RNA families

- ▶ Rfam database
- ▶ sequence + structure homologs
- ▶ conserved function

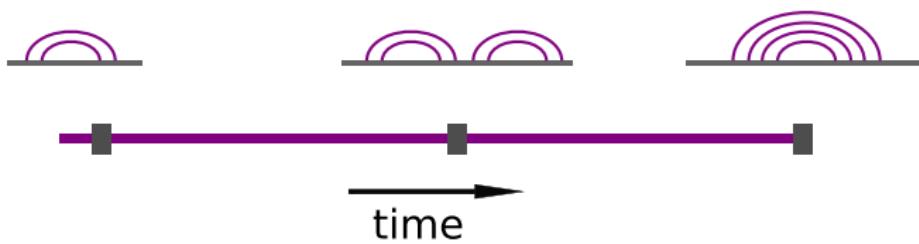

Hypothesis

- ▶ folding trajectories are conserved
- ▶ trajectories converge at functional intermediate states

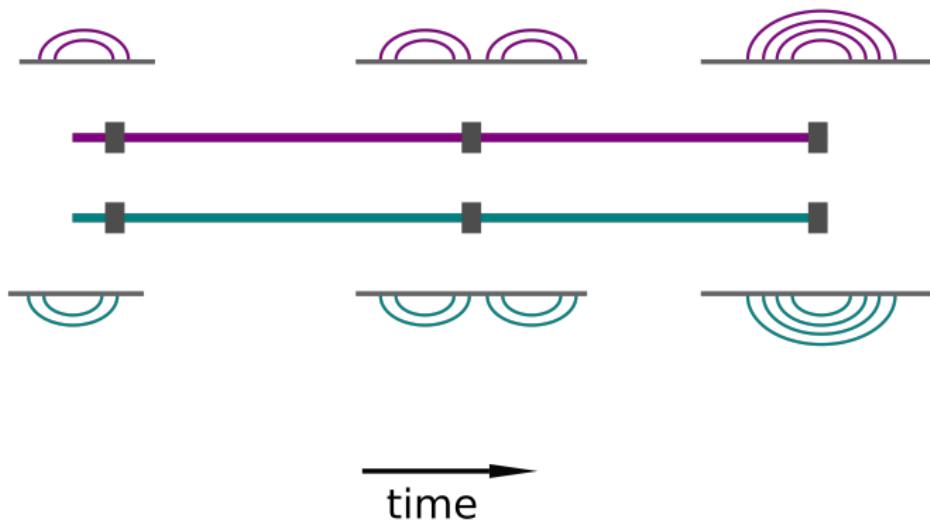

Possible functions

- ▶ guided folding
- ▶ interactions with ligands
- ▶ pausing sites
- ▶ ...

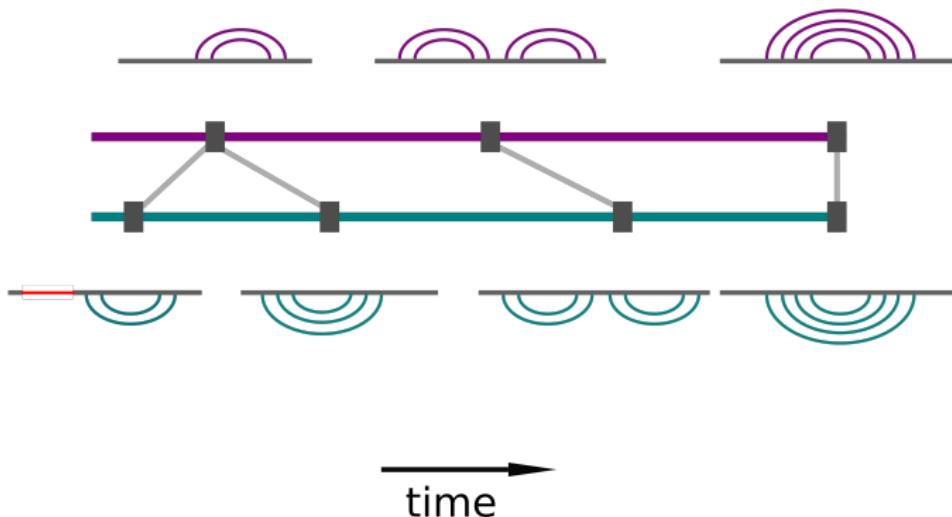

Kinetic folding trajectories

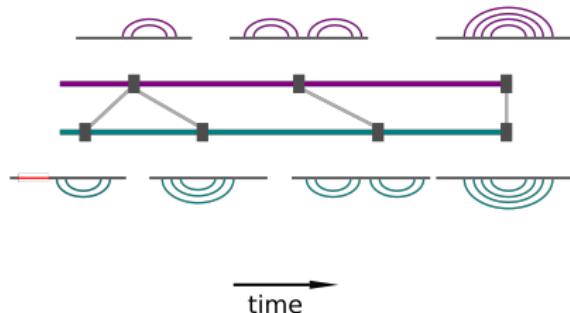

Comparing two trajectories

Comparing two trajectories

Comparing two trajectories

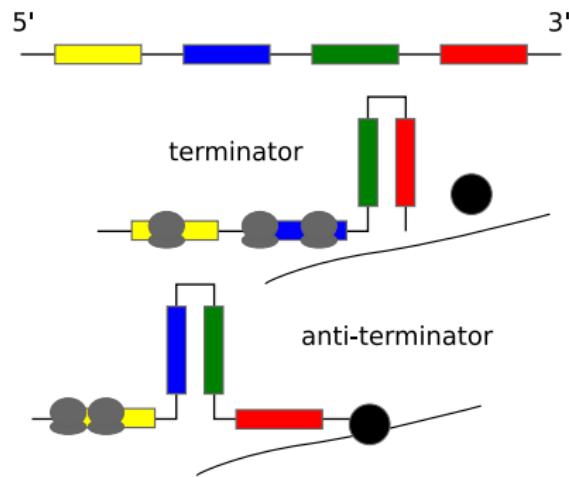

- ▶ different timescales
- ▶ sequence alignment
- ▶ scoring similarity of steps - structure
- ▶ shifted structures

Trajectory alignment

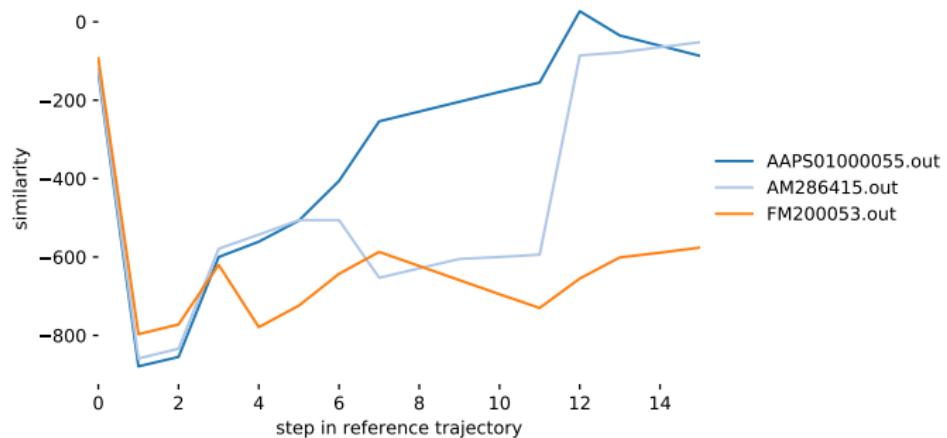

$$X(i,j) = S(i,j) + \max \begin{cases} X(i-1,j) \\ X(i,j-1) \end{cases} \quad (1)$$

- ▶ keeps order of steps over time
- ▶ independent of time scale
- ▶ $S(i,j)$ from RNAforester - structure score
- ▶ independent of sequence alignment

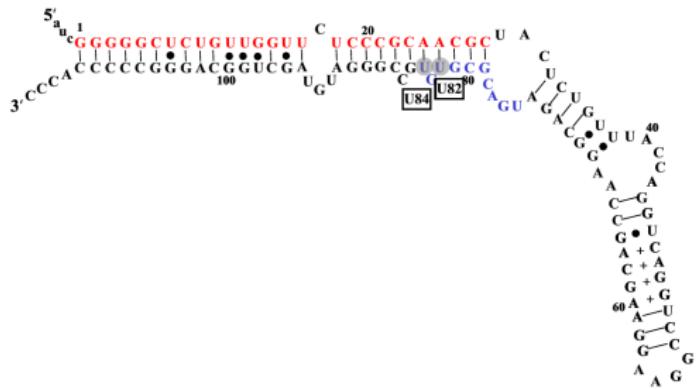

Example: TRP operon

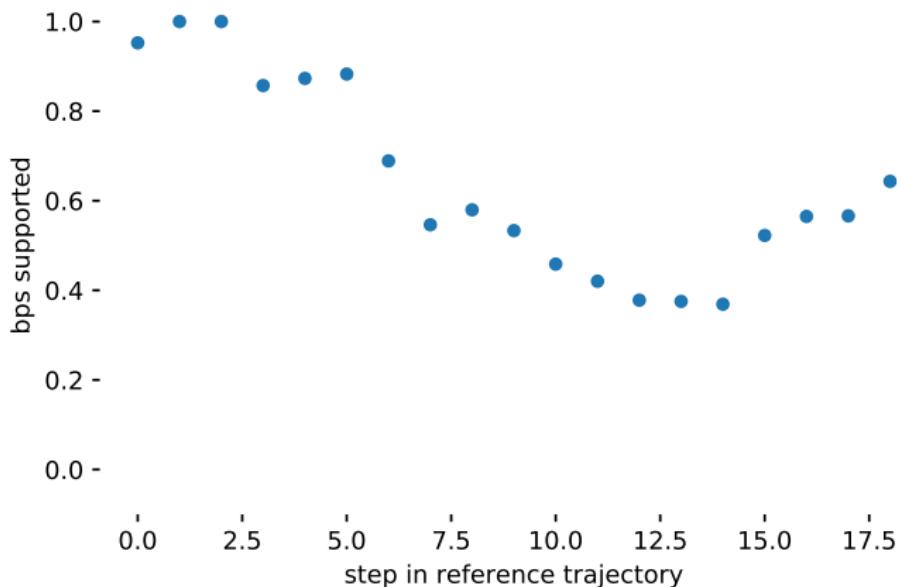

Example: TRP operon

Example: small bacterial SRP RNA

Example: small bacterial SRP RNA

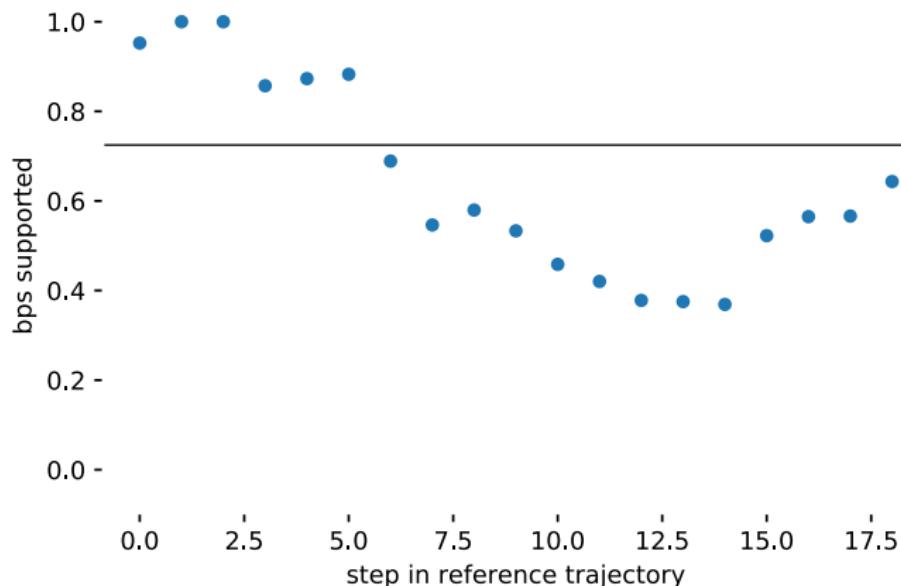

Background model

- ▶ choose ancestor sequence that can form final functional structure
- ▶ model evolution along phylogenetic tree of Rfam family
- ▶ run analysis on randomized alignment

Background model

- ▶ RNAinverse for modeling ancestor
- ▶ Sissi for modeling evolution
