Differentially expressed transcript regions in Alzheimer's disease

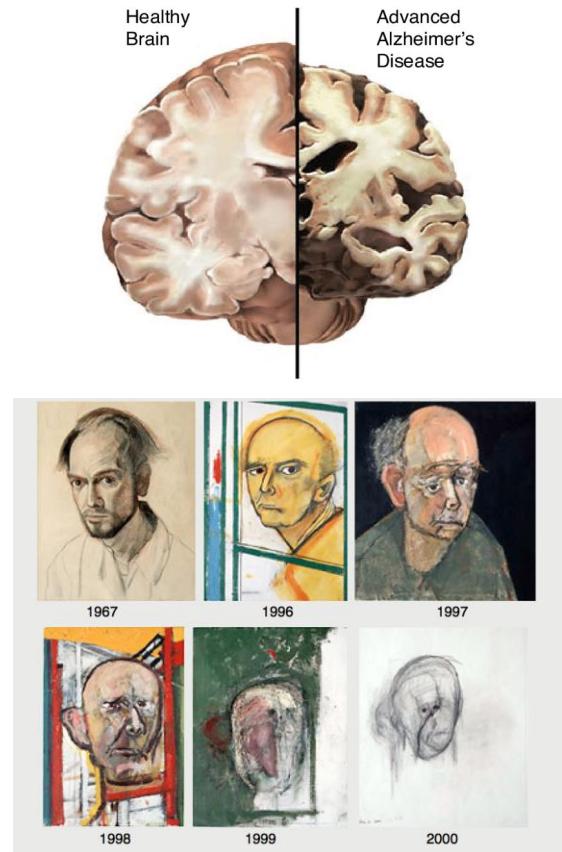

Bled, 14 February 2020

Leipzig University, Bioinformatik

Natasha Jorge

ALZHEIMER'S DISEASE (AD)

- Chronic neurodegenerative disease
- Memory loss, language problems, disorientation, mood swings
- Cause is unknown – plaques and neurofibrillary tangles
- No cure

New Results

Alzheimer related genes show accelerated evolution

with control samples [Supplementary Methods]. Applying this custom array to 19 AD patients and 22 control samples, we identified a differential expression of 154 multi-exonic cRNAs with a total of 4,162 splice sites and 141 multi-exonic lncRNAs with a total of 1,297 splice sites.

Expression

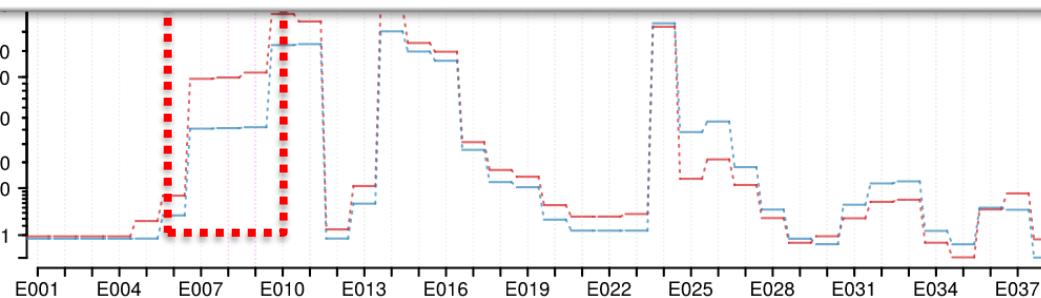

[FEBS Lett. 2006 Oct 30;580\(25\):5941-6. Epub 2006 Oct 5.](#)

alphaB-crystallin competes with Alzheimer's disease beta-amyloid peptide for peptide-peptide interactions and induces oxidation of Abeta-Met35.

Narayanan S¹, Kamps B, Boelens WC, Reif B.

Expression

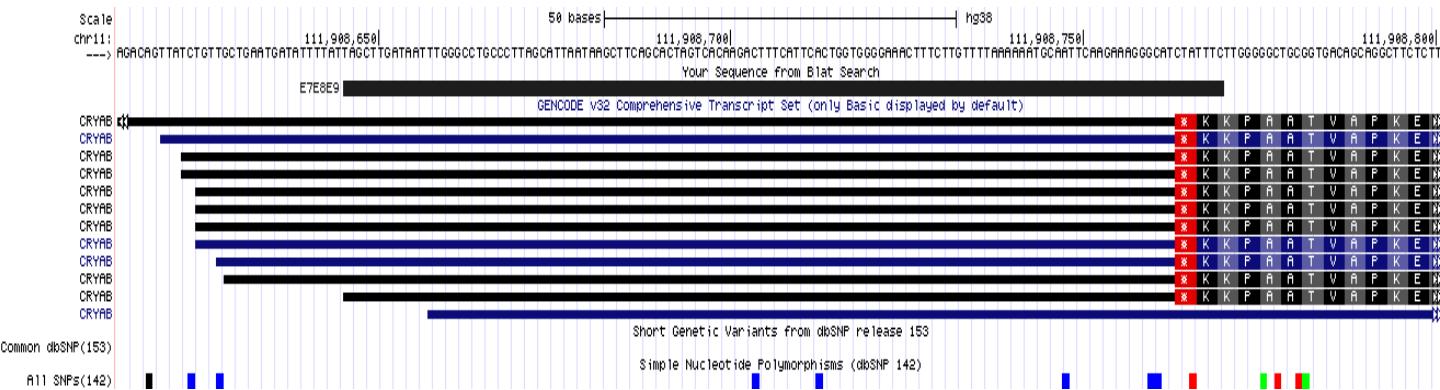

Layer III

CRYAB

CRYAB

63 miRNAs - TargetScan

Region	Number of DE regions	Genomic context
Layer III	52	23 introns 2 5' UTR 20 3' UTR
Area V and VI	34	14 introns 5 5' UTR 8 3' UTR
White Matter	61	22 introns 2 5' UTR 15 3' UTR
Whole Brain	3	All coding exons

PRELIMINARY CONCLUSIONS

- Different brain layers show different splicing patterns;
- The small number of DEU in Whole Brain samples might be due to the natural difference amongst layers;
- The DEU in the 5' and 3' regions might affect the stability and gene expression control mechanisms;

FUTURE STEPS

- Fresh Brains!!!! – DRS
- Differential expressed isoforms -> Ryuto
- Identification of AD related genes
- Putative miRNA target sites
- Putative polyA sites
