

Structure modelling of RNA virus genomes

Nan PAN

The 39th TBI Winterseminar in Bled 2024

11-16 February 2024

Overall workflow

Automatic integrated analysis of RNA secondary structure prediction

Challenge

RNA in PDB database : from **tens** to **thousands** of nucleotides.

X-ray diffraction, **NMR** and **electron microscopy** are the three main experiments used to study molecular structure.

Molecular crystals for X-ray diffraction

Challenge

Size of RNA in PDB database : from **tens** to **thousands**.

X-ray diffraction, NMR and electron microscopy are the three main experiments used to study molecular structure.

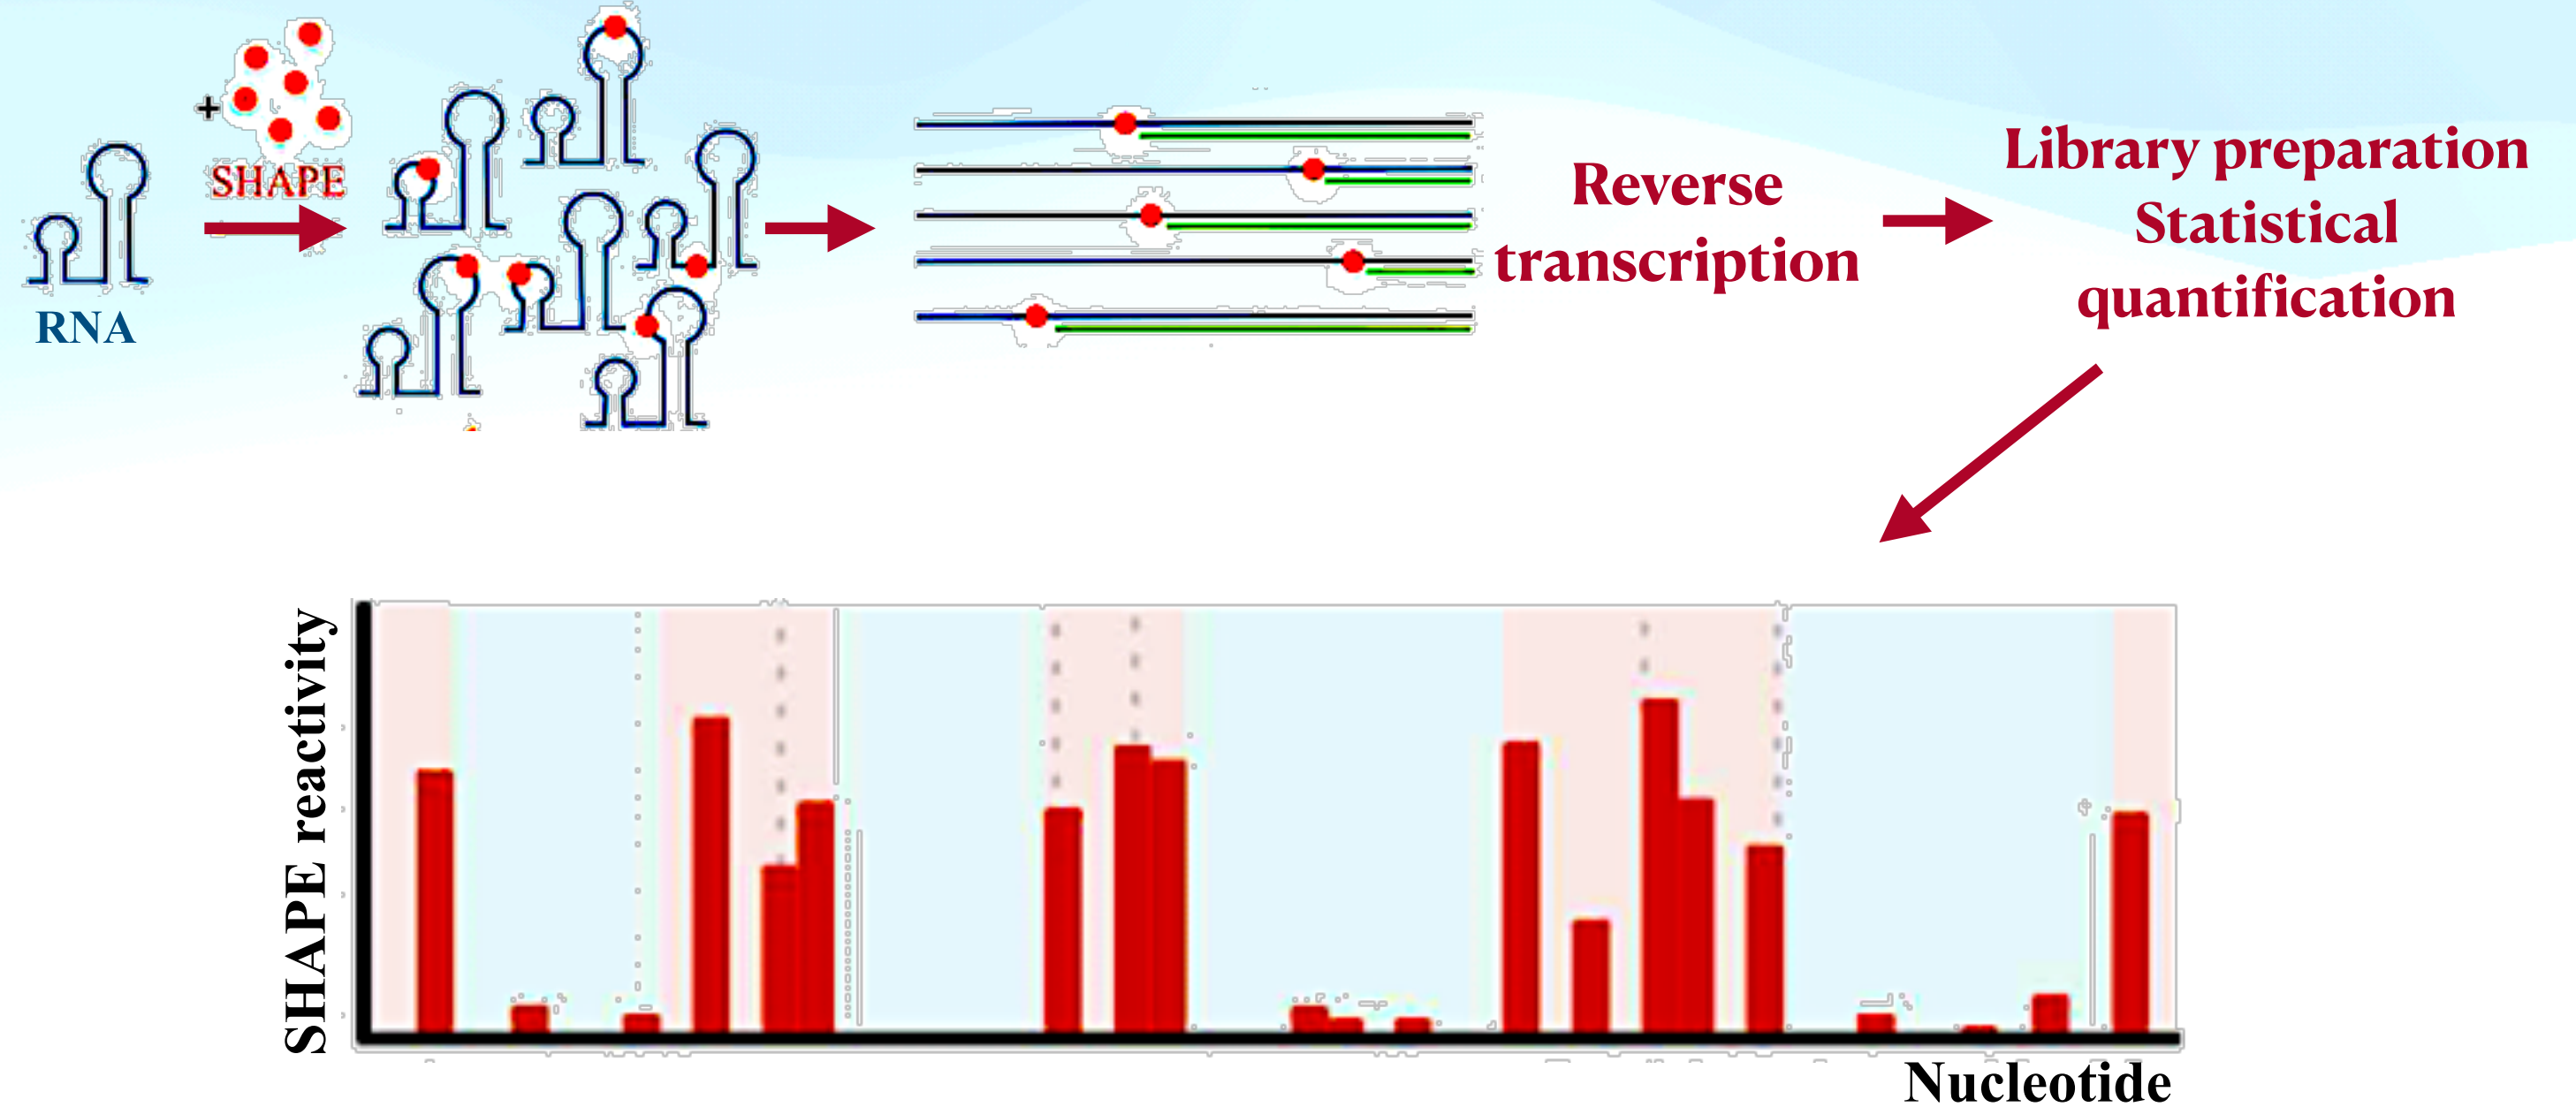

Molecular crystals for X-ray diffraction

The genome size of RNA viruses ranges approximately from **1.6k** to **31 k** nucleotides^[1].

SHAPE Experiment

[1] J. Cui et al., 2014, An Allometric Relationship between the Genome Length and Virion Volume of Viruses.

viral RNA

Strategy

Statistical analysis

+

**Application of existing
predictive tools**

+

**Comparison with
literature models**

**- Integrating diverse
experimental data.**

**- Designing efficient algorithms
and data structures.**

**- Modelling and predicting viral
RNA secondary structure.**
