

Sampling RNA Secondary Structure Landscapes for Kinetics Simulations

Ronny Lorenz
`ronny@tbi.univie.ac.at`

University of Vienna

Paris, France, October 3, 2018

RNA Folding Kinetics

Secondary Structure Free Energy Landscapes

$$\mathcal{L} = (X, N : X \rightarrow \mathcal{P}(X), f : X \rightarrow \mathbb{R})$$

- $X \dots$ Set of secondary structures
- $N \dots$ Structures obtained by formation / opening of a base pair
- $f \dots$ Free energy $E(s)$ of structure s

RNA Folding Kinetics

Secondary Structure Free Energy Landscapes

$$\mathcal{L} = (X, N : X \rightarrow \mathcal{P}(X), f : X \rightarrow \mathbb{R})$$

- $X \dots$ Set of secondary structures
- $N \dots$ Structures obtained by formation / opening of a base pair
- $f \dots$ Free energy $E(s)$ of structure s

Describe dynamic process of state transition as Markov process with master equation

$$\frac{dp_i(t)}{dt} = \sum_{j \neq i} p_j(t)r_{ji} - p_i(t)r_{ij}$$

$$\frac{d}{dt}\vec{p}(t) = \mathbf{R}\vec{p}(t) \quad \text{with formal solution} \quad \vec{p}(t) = e^{t \cdot \mathbf{R}} \cdot \vec{p}(0)$$

$$\frac{d}{dt}\vec{p}(t) = \mathbf{R}\vec{p}(t) \quad \text{with formal solution} \quad \vec{p}(t) = e^{t \cdot \mathbf{R}} \cdot \vec{p}(0)$$

State Space grows exponentially with Sequence Length!

RNA Folding Kinetics

State Space grows exponentially with Sequence Length!

- Focus on individual RNAs and perform Monte Carlo simulation, e.g. kinfold¹, Kinefold²
- Lump state space into macro states, e.g. barriers / treekin³

¹Flamm et al. 2001

²Isambert et al. 2001

³Wolfinger et al. 2004

RNA Folding Kinetics

State Space grows exponentially with Sequence Length!

- Focus on individual RNAs and perform Monte Carlo simulation, e.g. kinfold¹, Kinefold²
- Lump state space into macro states, e.g. barriers / treekin³

Still, vast numbers of trajectories or exhaustive enumeration of all states is required!

¹Flamm et al. 2001

²Isambert et al. 2001

³Wolfinger et al. 2004

Sampling Strategies

1. Exhaustive Enumeration⁴

- up to certain threshold δ above MFE
- only applicable to short sequences

⁴Wuchty et al. 1999

Sampling Strategies

1. Exhaustive Enumeration⁴

- up to certain threshold δ above MFE
- only applicable to short sequences

Draw representative structure samples instead...

⁴Wuchty et al. 1999

Sampling Strategies

2. Boltzmann Sampling⁵

Boltzmann distribution:

- $p(s) \propto e^{-E(s)/RT}$

Sampling Strategies

2. Boltzmann Sampling⁵

Boltzmann distribution:

- $p(s) = e^{-E(s)/RT} / Q$ with $Q = \sum_{x \in \Omega} e^{-E(x)/RT}$

Sampling Strategies

2. Boltzmann Sampling⁵

Boltzmann distribution:

- $p(s) = e^{-E(s)/RT} / Q$ with $Q = \sum_{x \in \Omega} e^{-E(x)/RT}$

Sample highly redundant and dominated by low energy states!

Example: Q β replicase template SV11⁶

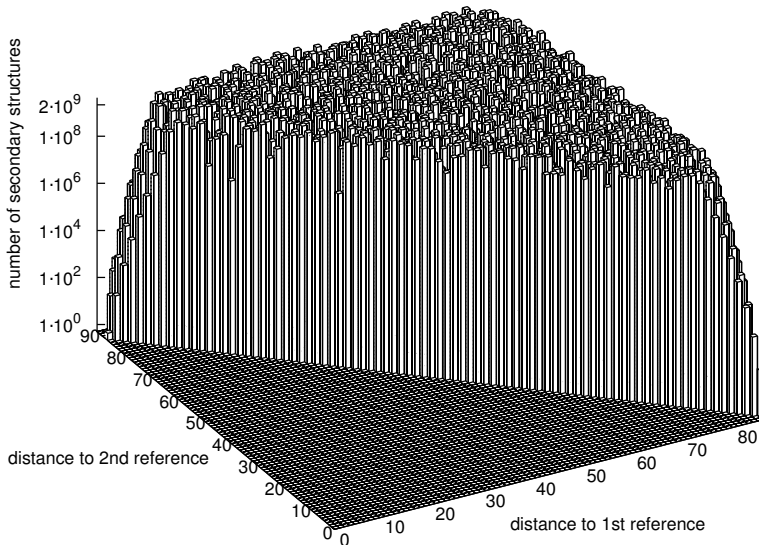

- artificial RNA sequence of 115 nt, $\approx 7 \cdot 10^{27}$ structures
- initially folds into metastable conformation
- metastable state is perfect template for Q β replicase
- spontaneously refolds into very stable rod-like MFE structure
- metastable state $> 30 \text{ kcal/mol}$ above MFE

⁶Biebricher et al. 1992

Example: Q_{β} replicase template SV11

2D Projection of Secondary Structure Landscape⁷

⁷Lorenz et al. 2009

Example: Q β replicase template SV11

2D Projection of Secondary Structure Landscape⁷

⁷Lorenz et al. 2009

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 10,000, # local minima: 35

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 10,000, # local minima: 35

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 50,000 / # local minima: 49

Example: $Q\beta$ replicase template SV11

Regular Boltzmann sampling

samples: 50,000 / # local minima: 49

Example: $Q\beta$ replicase template SV11

Regular Boltzmann sampling

samples: 100,000 / # local minima: 58

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 100,000 / # local minima: 58

Example: Q_β replicase template SV11

Regular Boltzmann sampling

Example: $Q\beta$ replicase template SV11

Regular Boltzmann sampling

samples: 500,000 / # local minima: 101

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 1,000,000 / # local minima: 132

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 1,000,000 / # local minima: 132

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 10,000,000 / # local minima: 259

Example: Q_β replicase template SV11

Regular Boltzmann sampling

samples: 10,000,000 / # local minima: 259

Sampling Strategies

3. Restrict Conformation Space

- Local minima (RNAlocOpt⁷)
- Flat structures (RNANR⁸)
- Local optimal stack configurations (RNASLOpt⁹)
- Shape abstraction (RNAShapes¹⁰)

Unfortunately...

- # of local optimal structures still grow exponentially
- most approaches show rather high asymptotic time/memory complexities

⁷Lorenz WA et al. 2011

⁸Michalik et al. 2017

⁹Li et al. 2011

¹⁰Steffen et al. 2005

Example: $Q\beta$ replicase template SV11

samples: 1,000,000, # local minima: 1,000,000

Sampling Strategies

4. Elevated Temperature Boltzmann Sampling

RNAlocmin¹¹:

- reminder: $p(s) = e^{-E(s)/RT} / \sum_{x \in \Omega} e^{-E(x)/RT}$
- iteratively draw samples at different $T = \xi \cdot T_0, \xi > 1$
- $T \rightarrow \infty$: uniform distribution

¹¹Kucharik et al. 2014

Example: $Q\beta$ replicase template SV11

RNAlocmin temperature elevation scheme Boltzmann sampling

iterations: 20, # samples: 1,000, # local minima: 528

Example: $Q\beta$ replicase template SV11

Sampling Strategies

5b. Sampling with (repellent) Guiding Potentials

Sampling Strategies

5b. Sampling with (repellent) Guiding Potentials

Sampling Strategies

5b. Sampling with (repellent) Guiding Potentials

- draw samples and determine corresponding local minima
- add most over-represented local minimum s_m to list L
- assign $\hat{E}(s)$ according to structures in L , e.g.

$$\hat{E}(s) = \sum_{s_m \in L} w(s_m) \cdot \frac{|s \cap s_m|}{|s_m|}$$
$$\hat{E}(s) = \sum_{s_m \in L} w(s_m) \cdot (d_{BP}^{max}(s_m) - d_{BP}(s, s_m))$$

...

Sampling Strategies

5b. Sampling with (repellent) Guiding Potentials

- draw samples and determine corresponding local minima
- add most over-represented local minimum s_m to list L
- assign $\hat{E}(s)$ according to structures in L , e.g.

$$\hat{E}(s) = \sum_{s_m \in L} w(s_m) \cdot \frac{|s \cap s_m|}{|s_m|}$$
$$\hat{E}(s) = \sum_{s_m \in L} w(s_m) \cdot (d_{BP}^{max}(s_m) - d_{BP}(s, s_m))$$

...

Choose moderate weighting factors, e.g. $w(s_m) = \gamma RT$

RNAexplorer repulsion scheme Boltzmann sampling (*distance*)

iterations: 300, # samples: 10,000, # local minima: 12,486

Sampling Quality

Goal:

- (relatively) low number of representative structures
- capture a diverse, yet important set of states

Use 2D projections and compare samples against `RNA2Dfold`¹⁴

- count number of samples per distance-class
- compute deviation of distance-class MFEs or Q, e.g. L1-norm
- distance-class coverage, e.g. $|\mathcal{C}(\delta)|$ with
$$\mathcal{C}(\delta) = \{C | Q_C^{\text{sampled}} \geq \delta \cdot Q_C^{\text{real}}\}$$

¹⁴Lorenz et al. 2009, computes MFE and Q in $\mathcal{O}(n^7)$

Sampling Quality - Partition Function Coverage

- SV11 example
- $\delta = 0.1$

Sampling Quality - Partition Function Coverage

- SV11 example
- $\delta = 0.5$

Conclusion

What's been done:

- Unsupervised directed repellent scheme
- Efficient Boltzmann sampling from distorted energy landscape $O(n^3) + O(k \cdot n \log n)$ for k samples per iteration
- Good approximation for even extreme cases

Next steps:

- Removal of too similar and shallow local minima
- Restrict guiding potential to structure domains
- Computation of effective transition rates
- Comparison of kinetics prediction against other programs
- Make RNAXplorer accessible
- Release non-redundant sampling for RNAsubopt
